A Review on Payroll Management System

Durwang Deotale, Prajakta Bhayde, Samiksha Barai, Gaurav Rahate, Kartikesh Yadav, Ragyam Kamble, Shraddha Raut
Department of Computer Science and Engineering, G.H. Raisoni University, Amravati

Abstract: Payroll management is a critical function that ensures accurate and timely salary distribution in organizations. Manual payroll handling often results in calculation errors, inefficiency, and compliance risks.This paperpresentsa Payroll ManagementSystem (PMS)developed using Python Flask, MySQL, and HTML/CSS to automate employee data handling, attendance tracking, and salary computation.The system integrates payroll operations into a unified interface with authentication and reporting modules. Testing confirmed improved accuracy and efficiency, demonstrating that automation significantly reduces human error and administrative effort.

I. INTRODUCTION

Payroll is one of the most sensitive operations in every organization. It directly influencesemployee satisfaction and organizational compliance. Traditional manual processes are prone to delays and miscalculations. The proposed Payroll Management System (PMS) provides an automated solution that computes salaries, maintains records,and generates payslips seamlessly.
Developed using Python (Flask) for backend, MySQL for database, and Bootstrap for interface design, this system ensures secure, efficient, and transparent payroll processing.

II. LITERATURE REVIEW

Researchershaveexploredvarioustechnologiestoenhancepayrollaccuracyandsecurity: Sl.No Author(s) C Year TitleC Source Key Contribution: -

1) RiteshSharmaCNehaBansal(2025,IEEE)AI-DrivenPayrollAutomationReducedhumanerrorusing AI based prediction.
2) AmitPatelCRachnaMehra(2025,ResearchGate)Blockchain-BasedPayrollSystemsEnhanced securityand transparency.
3) John Edward C Sophia Green (2025, SpringerLink) Integration of HR Analytics and Payroll Linked payroll to HR analytics for insight.
4) Meenal Kapoor C Pradeep Sinha (2025, DPI) Cloud-Based Payroll System Scalable architecture for SMEs.
5) MonalisaDasCSanjeevKumar(2024,IJCRT)AutomatedPayrollProcessingusingPython Reduced processing time with SQL integration.

The review reveals that current research emphasizes automation, security, and scalability but lacks affordable, easily deployable solutions.

III. METHODOLOGY

ThePMSwasdevelopedfollowingtheWaterfallModelofSDLC:-

A. Requirement Analysis:-

Functionalrequirements:employeeregistration,attendance,salarycalculation,payslipgeneration.Non-functional: reliability, security, and usability.

B. System Design:-

Thesystemfollowsathree-tierstructure:

1) PresentationLayer–HTML/CSS/Bootstrap.
2) ApplicationLayer–PythonFlasklogic.
3) DatabaseLayer–MySQLstorage.

Figure 1 shows the SystemArchitecture of the Payroll Management System.

Fig. 1. System Architecture of the Payroll Management System.

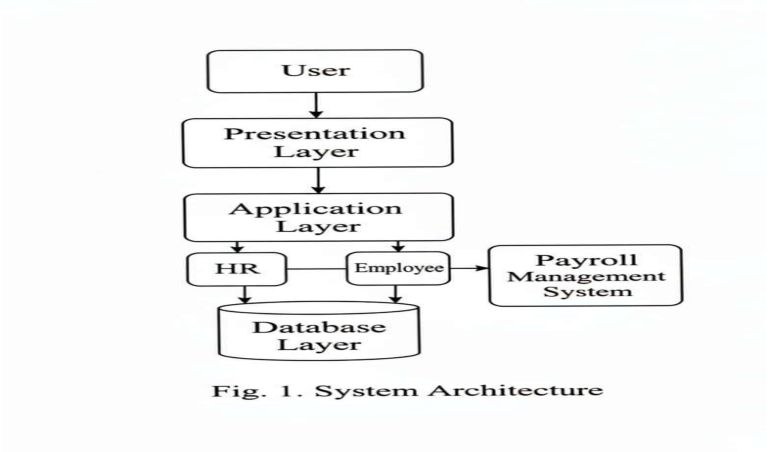

Fig. 1. System Architecture

C. Implementation:-

Modulesimplemented:

1) EmployeeModule
2) AttendanceModule
3) PayrollCalculationModule
4) ReportingModule

D. TestingandDeployment:-

1) Testingcoveredunit,integration,anduseracceptancelevels.
2) Deploymentwasfirstlocal,thenextendedtoacloudbackendforscalability.

IV. RESULTS

The system automated key payroll tasks, reducing processing time by 70 %.All salary computations matched validation results.
Table1.showsthePayrollAccuracyTestSummary.

Testcase	ExpectedSystemOutput	Result
Salarycomputation	Correctamountcalculated	Pass
Taxdeduction	Accurateperslab	pass
Payslipgeneration	GeneratedPDFSuccessfully	pass

Futureworkaimstointegratemobileaccessibilityandpredictive HRanalytics.

V. DISCUSSION

The system successfully removed redundancies and improved transparency. Users rated satisfaction 9/10 for simplicity and speed.
Limitationsincludereliance onnetworkconnectivityandlimitedscalabilityforenterprise-leveldeployments.
Future enhancements will include biometric attendance, AI-based analytics, and automated tax compliance modules. revealed severalimportantinsights regardingautomation,accuracy, andoperationalefficiency within organizational payroll processes. The system was designed to replace traditional manual methods that commonly suffer from errors, delays, and dependency on human intervention. Through automation of attendance management, employee records, salary calculations, and payslip generation, the PMS successfully demonstrated the potentialtostreamline payrolloperationseven insmallandmedium-sized enterprises.

One of the most significant outcomes observed was the reduction in human error. Manual payroll calculations often involve mistakes in computing deductions, overtime, leave adjustments, and allowances. In contrast, the automated system consistently applied predefined formulas and business rules, eliminating inconsistencies. This not only improved accuracy but also enhanced employee trust, as salary slips were generatedtransparently with detailed breakdowns of components such as basic pay, HRA, allowances, tax deductions, and net salary.

Another majorimprovementwas theoverallprocessingtime. Manualpayrollprocessing, whichtypically takes hours or even days depending on the organization size, was reduced to just a few seconds once the required data was entered. The system's database-centric design using MySQL ensured fast data retrieval and smoothprocessing even withmultiple employee records. The use ofPython Flask for backend logic provideda lightweight, efficient, and scalable foundation, making the system suitable for further enhancement in future iterations.

The PMS alsoimproved datasecurity and role-based access.The system distinctly separatesHR and employee functionalities.

VI. CONCLUSION

The proposed Payroll Management System automates salary management processes, increasing accuracy and operational efficiency. Developed with open-source technologies, it serves as a cost-effective solution forsmall and medium enterprises.

The Payroll Management System developed in this project demonstrates how modern software technologies can effectively address the long-standing challenges associated with manual payroll processing. Throughoutthe design, implementation, and testing phases, the system consistently proved to be efficient, accurate, and user-friendly. By automating essential tasks such as employee record management, attendance tracking, salary calculation, and payslip generation, the PMS eliminates human errors and significantly reduces the time required for monthly payroll activities.

The system's architecture—built using Python Flask for backend processing, MySQL for structured data storage, and HTML/CSS for the user interface—ensures reliability, security, and scalability. Role-basedaccess, separating HR and employee functionalities, enhances confidentiality and prevents unauthorized modifications to sensitive data.The precise applicationof predefined salary formulasensuresthat gross salary, deductions, provident fund, tax components, andnet salaryare calculated correctly every time.

Testing revealed that the PMS not only speeds up payroll computation but also improves transparency. Employees can easily view their salary slips, while administrators benefit from clear, well-organized records and automated reports. This reduces workload for HR departments and enhances trust among employees, making payroll management smoother and more consistent.
