# A Survey on Emergency Vehicle Route Optimization and Traffic Management Application

Sathvik S P<sup>1</sup>, Deepak S P<sup>2</sup>, Ranganatha P<sup>3</sup>, Harshavardhan M N<sup>4</sup>, Asst. Prof. K. N. Prashanth Kumar<sup>5</sup>,  
<sup>1, 2, 3, 4, 5</sup>Department of Computer Science and Engineering, Bangalore Institute of Technology, Bengaluru, India

**Abstract:** Ambulance delays in India result in approximately 10,000 lives lost annually, highlighting the critical need for efficient emergency response systems. To address this issue, we present the "Emergency Vehicle Priority with Route Optimization and Traffic Management Application." Leveraging advanced technology, including an Android application, Firebase, and IoT integration with traffic signals, our system dynamically calculates and optimizes ambulance routes using Google API, minimizing delays and improving overall efficiency. The application facilitates seamless coordination between ambulance drivers and traffic police officers, triggering real-time route updates and traffic signal adjustments to expedite ambulance passage. By streamlining traffic flow and enhancing emergency response coordination, our solution aims to significantly reduce ambulance delays and save lives in urban areas.

**Keywords:** Android Application, IoT, API, Firebase, Emergency Vehicle Priority, Route Optimization, Traffic Management, Urban Emergency Response, Real-time Coordination.

## I. INTRODUCTION

In urban areas worldwide, the efficiency of emergency response systems is of utmost importance for public safety. Recognizing this urgency, we introduce the "Emergency Vehicle Priority with Route Optimization and Traffic Management Application." This project represents a paradigm shift, leveraging cutting-edge technology to streamline coordination between emergency vehicles and traffic authorities. While alarming statistics underscore the urgent need for innovative solutions, including the approximate loss of 10,000 lives annually in India due to ambulance delays, our focus is on implementing proactive measures to address these challenges. In addition to establishing real-time communication and data integration and minimizing response times with optimized routes, our application includes automatically turning traffic signals green when an ambulance approaches within a specified radius. This further expedites the ambulance's passage, reducing response times and potentially saving lives. With automated notifications and robust data-sharing mechanisms, our aim is to enhance and modernize emergency response systems, ultimately ensuring swift and efficient emergency services. The application's versatility makes it adaptable to diverse urban environments, with the potential to integrate seamlessly into existing traffic management systems and emergency service protocols.

## II. OBJECTIVES

- 1) To accomplish seamless real-time communication and data integration between emergency vehicles and traffic management systems.
- 2) To minimize travel times in emergency by providing optimized routes that adapt to dynamic traffic conditions.
- 3) To build an integrated "Emergency Vehicle Priority with Route Optimization and Traffic Management Application" that serves as a platform for real-time data exchange between the traffic police and ambulance drivers.
- 4) To design a user-friendly interface for ambulance drivers and traffic police officers to access and utilize real-time data and route optimization features effectively.
- 5) To implement automated notifications and alerts to traffic police officers when emergency vehicles approach traffic signal points.

## III. LITRATURE SURVEY

In this paper [1] proposed a system presents a system to reduce travel time and broadcast delay of emergency vehicles while enhancing traffic efficiency and safety. It employs visual sensing techniques, including distance measurement and vehicle counting using image processing. The system utilizes the PE-MAC protocol for efficient data delivery to the traffic management center and a distance-based dispatching algorithm to optimize traffic signal control. Limitations include reliance on visual sensing susceptible to adverse conditions, assumptions about wireless communication availability, and lack of theoretical analysis for algorithm optimality.

In this paper [2] introduces an Internet-of-Things (IoT) based platform aimed at improving traffic control for emergency vehicles at intersections. The system focuses on traffic flow modeling techniques and simulation using SUMO (Simulation of Urban Mobility). It incorporates an Emergency Vehicle Priority System (EVPS) that assesses priority levels based on incident severity. However, challenges such as implementation complexity, cost implications, and compatibility issues are acknowledged, highlighting the need for further research and development in this area.

In this paper [3] proposes a system to reduce waiting times for emergency and non-emergency vehicles at intersections. It utilizes an intersection controller, force resistive sensors, GPS, and ZigBee communication to manage traffic flow and prioritize emergency vehicles. However, limitations include the lack of experimental validation, consideration of security issues, and comparison with alternative solutions.

In this paper [4] presents a system allowing emergency vehicles to control traffic lights via SMS technology and a mobile application. It utilizes GSM/GPRS/GPS modules, Arduino Uno boards, and relay boards for communication and control. Limitations include reliance on GSM infrastructure, potential distraction to drivers, and compatibility issues with existing traffic systems.

In this paper [5] introduces a system based on IoT and cloud technology for aiding emergency vehicles in reaching their destinations promptly. It involves an emergency vehicle crew and app, cloud infrastructure, microcontrollers, and traffic signals. The system dynamically adjusts traffic signals based on real-time GPS data from emergency vehicles. Limitations include reliance on driver input for emergency level, lack of coordination among multiple vehicles, and potential conflicts at intersections. Further enhancements could address these challenges to improve efficiency and safety.

In this paper [6] proposes an RFID-based traffic control system to detect and prioritize emergency vehicles at intersections. The system utilizes RFID tags on vehicles and readers on traffic signals, along with a dynamic traffic sequence algorithm. It aims to reduce travel time, prevent crashes, and improve traffic flow efficiency. Limitations include cost, reliability, security concerns, and compatibility issues with existing infrastructure. Further research could focus on addressing these limitations and enhancing the system's scalability and effectiveness.

In this paper [7] proposes an image processing-based traffic signal adjustment system to manage traffic density and prioritize emergency vehicle passage. It utilizes techniques like image acquisition, edge detection, and LED control to modify signal timings. Limitations include weather sensitivity, potential inaccuracies in accident detection, and the need for additional technologies like thermal imaging. Enhancements may involve weather-proofing the system, refining accident detection algorithms, and integrating complementary technologies for improved performance.

In this paper [8] introduces an Android app leveraging Vehicular Ad Hoc Networks (VANETs) and Smart Traffic Control Units (STCUs) for traffic management and emergency vehicle prioritization. VANETs facilitate real-time communication among vehicles, while STCUs adjust traffic signals based on evolving traffic conditions. Challenges include network congestion, connection instability, and authentication overhead in VANETs. Mitigation strategies may involve optimizing communication protocols, enhancing network stability, and implementing lightweight authentication mechanisms.

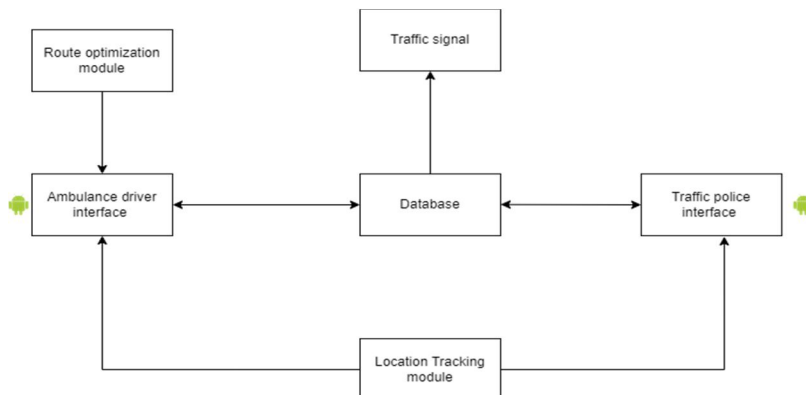

In this paper [9] proposes a system utilizing IoT sensors, GPS, 5G communication, and cloud computing to streamline emergency vehicle movement. It categorizes emergency vehicles and employs dedicated lanes (Shoulder Lanes) for their passage. Roadside Units (RSUs) and a control unit manage traffic flow and prioritize emergency vehicles. Challenges include dependency on advanced technologies, maintenance requirements, sensitivity to false alarms, and initial cost barriers. Strategies for overcoming these challenges may involve robust system design, regular maintenance protocols, accurate detection algorithms, and strategic financial planning. In this paper [10] The paper introduces an advanced traffic control system for emergency vehicles using Li-Fi technology and vehicle-to-vehicle communication. It proposes a method for transmitting information from the emergency vehicle to the traffic signal system via light signals. Limitations include Li-Fi's limited coverage range and susceptibility to weather conditions, along with potential power consumption concerns and implementation costs.

#### IV. PROPOSED SYSTEM

- 1) Our proposed system, the "Emergency Vehicle Priority with Route Optimization and Traffic Management Application," is aimed at minimizing the travel time of emergency vehicles through optimized routes and streamlined traffic flow.
- 2) This system enhances emergency service efficiency by prioritizing emergency vehicles, optimizing their routes, and managing traffic flow to ensure timely and safe passage.
- 3) This system includes features for real-time coordination between emergency vehicles and traffic authorities, facilitating proactive adjustments to traffic signals and routes based on dynamic conditions.

- 4) The system incorporates predictive analytics capabilities to anticipate traffic patterns and optimize routes preemptively, further reducing response times and improving overall emergency service delivery.

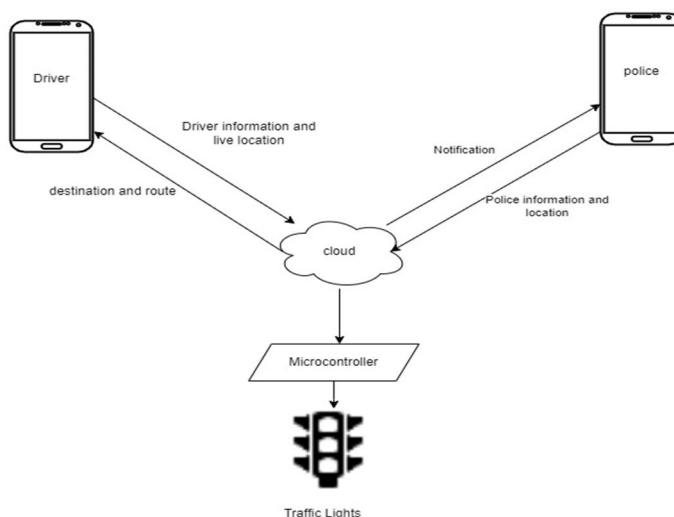

### V. BLOCK DIAGRAM

### VI. COMPONENT DESIGN

- 1) *Ambulance Driver Interface*: This module is designed for ambulance drivers to interact with the system. It includes features for updating destinations, real-time route calculation using Google Maps API, and receiving traffic signal information from Firebase.
- 2) *Traffic Police Interface*: This module is tailored for traffic police officers to receive notifications via Firebase Cloud Messaging when an ambulance approaches a traffic signal. It also includes an IoT system that autonomously adjusts traffic signals to expedite the ambulance's passage.
- 3) *Database*: The system utilizes Firebase for real-time data storage, retrieving traffic signal locations, and storing historical data for analysis and optimization.
- 4) *Location Tracking Module*: This module uses GPS to track the location of emergency vehicles in real-time, enabling accurate route optimization and traffic management.
- 5) *Route Optimization Module*: This module calculates the most effective route for ambulances using Google Maps API, taking into account dynamic traffic conditions and traffic signal locations.
- 6) *Traffic signal*: This module dynamically adjusts traffic signals based on the location and priority of emergency vehicles, ensuring smooth traffic flow and timely assistance.

### VII. BLOCK DIAGRAM

### VIII. CONCLUSION

In summary, this paper presents a significant advancement in urban emergency response systems. Through the seamless integration of real-time communication, dynamic route optimization, and efficient traffic management, our project addresses critical challenges faced by emergency vehicles during health crises in urban areas. With a user-friendly interface and versatile functionality, our solution enhances emergency service efficiency by prioritizing vehicles, optimizing routes, and managing traffic flow. The project's scope encompasses algorithmic route optimization, secure communication protocols, and collaborative interfaces, demonstrating our commitment to a comprehensive solution adaptable to diverse urban environments. Automated notifications and robust data-sharing mechanisms foster collaborative efforts among emergency responders, creating a synchronized and effective emergency response network. Beyond technological innovation, this project signifies a step toward a safer urban landscape, where every second counts in optimizing emergency response systems for community well-being. Looking ahead, the envisioned future includes enhanced route optimization algorithms, predictive traffic analysis, scalability, and integration with existing traffic management systems, offering vast potential for further improving emergency response services. In the face of ongoing urbanization and increasing demands on emergency services, initiatives like the "Emergency Vehicle Priority with Route Optimization and Traffic Management Application" play a crucial role. By embracing innovation and leveraging technology, we can continue refining and enhancing emergency response systems, ultimately saving lives and safeguarding communities.
