AI-Enhanced 3D Bioprinting

Sriganesh V
UG Student, Department Of Biomedical Engineering, SRM Institute Of Science And Technology, Ramapuram Campus

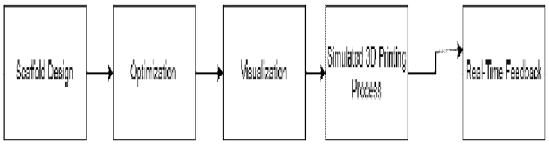

Abstract: Bioprinting fabricates living tissues by layering cells, bioinks, and biomaterials through 3D printing techniques [1]3D bioprinting builds life-like tissue structures by depositing bioink blends containing living cells [2]AI-driven bioprinters arrange living cells with precision to mimic the intricate design of human tissues [3].Miniature organoids could revolutionize drug testing, disease models, and, in the future, organ transplantation [3].
Keywords:3D Bioprinting,AI-driven Tissue Engineering

I. INTRODUCTION

AI enhances bioprinting automation, minimizing human error and ensuring consistent tissue production [4].AI-driven automated bioprinting adjusts in real-time to perfect tissue structures like skin grafts, enhancing patient outcomes in transplantation by optimizing bioink, medical imaging, and printing techniques [5].AI in bioprinting automates medical imaging, predicts ideal bioink compositions, and adjusts printing parameters in real time to ensure precision and compatibility[6].Thomas Boland pioneers the first bioprinter as the human genome is fully mapped, both physically and functionally [7].3D bioprinting entered medicine when Harvard researchers at Boston Children's Hospital created the first hand-built urinary bladders by layering patient cells onto collagen and polymer scaffolds [8].
Keywords:AI-Driven Automated Bioprinting,Personalized Tissue Engineering

II. LITERATURE REVIEW

Bioprinting offers a promising solution to the organ transplant shortage by advancing tissue creation techniques [9].A 3D bioprinter operates like a regular 3D printer, with one key difference[9].AI-driven quality control in 3D bioprinting could transform tissue engineering, enabling tailored regenerative medicine solutions [10].AI tools simplified the iterative optimization of bioprinting parameters and their interaction analysis [11].AI-driven quality control in 3D bioprinting enhances regulatory compliance and standardization, ensuring the security and effectiveness of components [10].
Keywords:AI-EnhancedRegenerative Medicine,Bioprinting Quality Control

III. METHODOLOGY

Stem cells are ideal for bioprinting, enhancing proliferation and closely mimicking the function of original cells [12].Recent advances in 3D bioprinting allow researchers to develop in vitro models with precise micro-architectures for drug testing and disease modeling[13].AI is now integral to 3D bioprinting, enhancing stages like medical imaging, bioink selection, and printing by managing large datasets, performing complex calculations, and optimizing processes through machine learning[14].

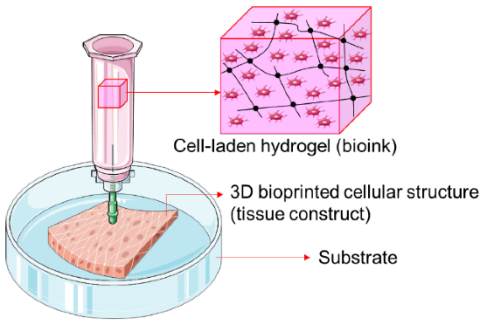

BIOINK

Bioinks, composed of living cells and biomaterials, replicate the extracellular matrix to support cell adhesion, proliferation, and differentiation post-printing[15].

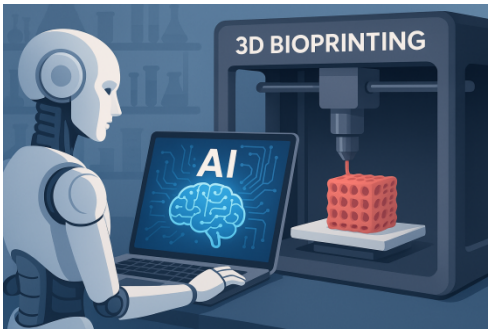

HYDROGELS

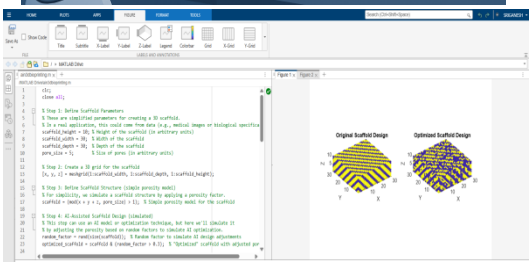

Hydrogels, water-swollen 3D polymer networks with customizable properties, are vital in biomedical research, from studying mechanisms to tissue regeneration and disease treatment [16].

AI optimizes the 3D printing process, reducing waste and enabling the creation of new materials, while human expertise is often needed to choose the best raw material from numerous options.[17].While machine learning has advanced printer parameter optimization, manually curating datasets remains time-intensive [18].3D bioprinting is poised to surpass current tissue engineering, revolutionizing the treatment of skin injuries [19].Certain algorithms in 3D printing address these challenges by managing data collection, storage, processing, and analysis [20].Changes in thickener concentrations in bioink minimally affect cellular organization and morphogenesis but influence the shape accuracy of bioprinted structures [21].

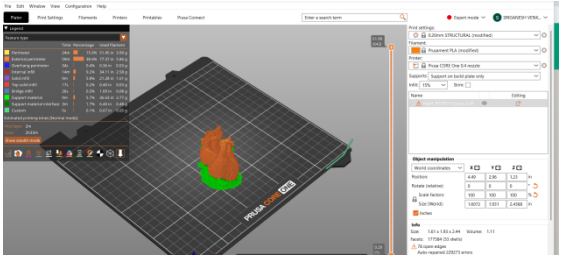

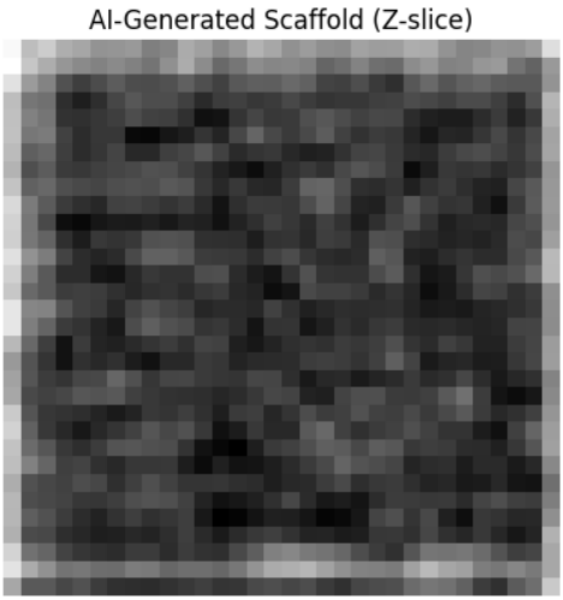

Keywords:Stem Cell-Based Bioprinting,Bioink and Hydrogel Optimization

V. RESULTS & DISCUSSIONS

This MATLAB code simulates scaffold design and 3D printing by first creating a basic scaffold structure with porosity, then optimizing the scaffold using a random factor to simulate AI-assisted design adjustments, and finally visualizing the original and optimized scaffold designs, as well as a simulated layer-by-layer 3D printing process. Using PrusaSlicer and MATLAB, we build AI for 3D bioprinting based on real-time feedback, incorporating scaffolds into the MATLAB program.This work suggests the use of an AI model to optimize 3D bioprinting of scaffolds, with Google Colab for development and Matplotlib for data presentation.
