AI Powered Education

Sinchan Mallick[1], Rittwika Datta[2]
Department of Computer Science and Engineering (Artificial Intelligence), Institute of Engineering and Management (IEM) Kolkata-91

Abstract: ***Education, as a vital institution, continuously benefits modernization, with artificial intelligence (AI) driving a paradigm shift in teaching and learning. This research presents an AI-powered e-learning system that delivers personalized academic notes tailored to students' needs. Utilizing a Large Language Model (LLM) like Gemini, the system comprehends student queries more effectively, enabling customization of content across diverse subjects and academic levels. Prompt engineering ensures that information remains accessible, accurate, suitable for different age groups. Key features of the system include an AI-based chatbot interface developed using HTML, CSS, and JavaScript, providing user-friendly experience. The back-end integrates with the LLM via an API to process student inputs and generate relevant information in real time. Additionally, light and dark modes usability, making the platform adaptable to user preferences. It also outlines the system's design, data preparation, prompt engineering methods, and integration of the front-end and back-end. It highlights key challenges, such ensuring response clarity, maintaining student engagement, and managing different learning speeds. Initial testing, with student feedback, revealed high response accuracy, usefulness, and user satisfaction, underscoring AI's potential in enhancing learning quality and engagement. With its adaptability to multiple subjects, the system is positioned as a crucial tool in modern education. This project demonstrates how AI can transform established learning paradigms, delivering personalized education and significantly enhancing learning experiences.***

Keywords: ***AI-powered e-learning; personalized notes; large language models; intelligent tutoring systems; educational technologies***

I. INTRODUCTION

In human evolution, education has been an excellent way to pass on knowledge, skills, and values from one generation to other generations, but quite often traditional educational methodologies could fail to meet multiplicity of learning need types, individual pacing of learning needed for students; hence, poor achievement gaps in education. These achievement gaps arise primarily as a result of the structure of traditional classrooms, which have a generalizing effect on all the other different learning styles. The technologies were supposed to greatly help in the evolution of highly personalized and adaptive learning environments could greatly assist such artificial intelligence (AI) proposal. It is such an AI-enabled online system that can automatically generate personalized academic summaries according to the student's personal learning needs. That will be the bridging tool between the old teaching style and the idea of personalized learning by the power of AI: LLMs can now be used effectively for developing AI capabilities in interpreting the students' questions -- hence giving them custom-made content down to the detail, explanations, and notes regarding the context thereof. This intelligent system is grounded in the fast engineering needed for proper assignment of very accessible, clear and accurate answers in layman language to the younger population of school-goers. The interactive chatbot, which was not made from HTML, CSS, and JavaScript in the frontend, is not only user-friendly but it also presents a seamless means for students to interact with the system. One can also enjoy light and dark display modes, which enhance enjoinment on the part of the user due to comforts in different light settings. The back-end architecture hooks with the AI model when some API calls, all the while making it possible to process the inputs in real-time and generate personalized notes. Today, educators are more concerned about smarter, more adaptive learning systems. The traditional classroom learning model is considered inadequate for a lot of students, as teachings cater to a common denominator that can either get students left behind or not properly motivated. For instance, students who are intelligent, move ahead will become detached while slow-learners will always find themselves left or behind. This necessitates a learning environment that draws up smart, tailor-fit learning which better adjusts to the strengths and weaknesses of each learner. The highlighted paper presents AI-fueled new approach wherein specified academic support is packed with evolutional learning that is going well beyond the speed that AI technology itself has grown. The involvement of learners by the AI-aided approach remains the factor whereby machine support aids those students to expedite the process through their learning sequence, as it designs feedback for prompt engineering systems which act as inputs that are equipped to allow the AI to learn through its own manufacture. The crafting of prompts corresponds to specific educational goals and serves as a feedback loop for understanding the user traits. It responds strikingly strong with respect to appropriate prompt construction concerning learning goals and user traits.

In an active democratic regional language section fostering and knowledge multiplication, it causes an increase in inquisitive and remembrance-oriented approaches that one wishes to see fostered in prospective students. As an additional feature, the system should get personalized output to an individual and should be very closely interconnected and responsive to what the input is asking for. More so, by devising prompts and having specific educational objectives in mind a nd using them to show the features of users, the system facilitates the production of informative and contextually relevant responses for improved comprehension and reinforcement. In addition, the user interacted not only with content-creation procedure issues but directly with the chatbot interface, which was designed to make more engaging and relevant learning more interactive in terms of its communication structure than the typical e-learning platform. As opposed to passive, linear, and synchronous learning presented by commonplace e-learning platforms, chatbot interfaces give an atmosphere of conversational learning where students can pose questions, request clarifications, or even branch out to topics, thus rendering a higher contextualization and much more dynamic learning from inside the user's edgy innocence. Moreover, there is an existence of an option for customization such as light and dark that emphasizes the user-centered design principle purposed to enhance comfort and accessibility. Visual strain as well as access challenges, and then exacerbated by the greater learning immersion with digital content, all definitely have negative impacts in the educational experience of students. The indirect response system has different display themes options considering, among others, varied user preferences, as well as environmental conditions; because of opportunities available and possibilities, the system's strong point is usability and sustaining engagement, where engagement itself is a big component of usability. This project was inspired by the need to develop something more innovative and beyond the limits of traditional educational delivery. The rigid nature and deep-rooted traditional design of classrooms usually keep many students on the outside-either disengaging them or leaving them struggling just to keep pace. Conversely, the system described is one which can scale up from the artificial intelligence developed to create an e-learning solution, which customizes each academic subject and grade level for each individual student. The place discusses the designing, development and implementation of an intelligent-based automated e- learning system formulating a basis for AI, fast engineering, and user-friendly interface design. It makes education in another series of steps in pursuit of individual learning of students with new courses of action: personal learning paths, adaptive content delivery, and interactive engagement which redefine learners' learning experience. This kind of transformative proposition-not only to establish good academic outcomes but also one of the most sophisticated and highly valued connections to learning on which education becomes an all-encompassing, truly effective, and, most importantly, accessible reality for everyone who accesses it.

II. PROBLEM STATEMENT

It has become inevitable rather than an option that the integration of technology into education is taking place indeed. The changes brought fast by technology are affecting almost all sections including education. The increased expectation of modern educational needs prove that the old method is insufficient for multiple learners today. Modern education has made it clear beyond doubt that the proven classical methodologies are insufficient to meet the varied learning needs, styles, and preferences of today's students. Most traditional classroom models were grounded in the uniformity of a one-size-fits-all application, thereby failing to address the individual pace of the child with its subsequent disengagement. Therefore, there is an urgent need for innovative solutions suitable for the varied pace, abilities, and understanding levels of each learner. Intelligent Tutoring Systems (ITS) are one such promising innovation specific to this direction.

They are one of the most advanced methods of educational technology and use artificial intelligence (AI) to code personalized learning paths on machine-learning-driven systems. Comparable to conventional teaching mechanisms, ITS aims at imitating the effectiveness of a human tutor by continuous monitoring of student performance, tracking learning gaps, and supplying tailor-made instructional resources.

In this way, students can learn to receive individual practice exercises, immediate constructive feedback, and further develop the ability to master even the most complex concepts or rules easily. This is possible through adaptation at the level of human learning research, where an automated prompt is given to a student upon recognizing the piece of intelligent software based on his/her feedback, and this learning material is arranged and covered in a way definitely for avoiding any possible misinterpretation within the learner. In ITS, machine learning plays an even greater role because often large swathes of data are processed in order to yield learning patterns, preferences, and behavior of the students. Then, on the basis of that, the system tries to predict what might come next and may even help to set those targets.

III. OBJECTIVES

The Intelligent Tutoring System can be highly beneficial by design for the very core mission in raising delivery in a real sense by involving students in the learning process essentially multifunctional with all the interactions and engagements. Our aim is to close the gap created by the traditional systems by putting into use the technological resources- in modern times- to increase the efficiency of a student in learning and better academic output. This formation will integrate sophisticated machine-learning-based tools that can continuously look inside the data that tells about the behaviors of individual learners. ITS learns the trends in learning associated with preferred styles and identifies difficult areas of students. Hence, it is capable of accommodating concerning learner diversity in terms of the content and strategies. This dynamic type of adaptation makes learning very individualized, totally keeping up-and challenging the learner. Generation AI introduces these advanced artificial intelligence models that create tailor-made learning stuff for each student. Generation AI includes learning ways that are largely particular to each student's levels but rather pay more attention to weak verbs against strengthened subjects. The content is generated for engaging learning preferences and identifying the gaps in the knowledge of a candidate so that it is hardly a far cry from a one- time learning experience over typical learning media. Its adaptive personalization makes learning dynamic, moving at the pace of, or creates challenges unique to, every individual. It offers personalized assets, dedicated support, and critical feedback for mastering ITS dynamic tailoring offers instruction. While live-adjusted paths map student progress, they adapt activities in between to be challenging- not too easy and not too difficult and allow for individual pacing, making study much more engaging and less tiresome. Our Intelligent Tutoring System encourages engagement and reinforcement goals whereby students achieve a deeper conceptual grasp of subjects. The system provides rationalized advances along topics in stepwise method along with further detailed explanations to learner's level of comprehension. For a consolidated and fluent command of the subjects and advanced enthusiasm in learning, learning with confidence and trust is built up by assuring that the knowledge foundation has been solidified before advancement occurs. Personalized and adaptive learning methodologies lead to improved academic performance because they tend to hit the kind of subject areas upon which a student needs to concentrate their effort. Its continuous tracking and adjusting also allow for timely interventions to meet emerging knowledge gaps. Feedback from regular and actionable measures helps students in realizing their mistakes and challenges them into seeing a growth mindset as a critical avenue to success. All the ITS systems provide immediate, interactive feedback on quizzes, exercises, or practice problems with contextual hints and detailed explanations to the students. Continuous changes are made in the System's content where users have input, resulting in the creation of a looped feedback mechanism well suited to the providence of constant improvement. Apart from student engagement, the ITS can also help teachers with data-driven insights about the student's state of performance. With set on strengths, weaknesses, and learning trends, such report summary enables informed decision-making on personalized teaching methods and group instruction. Intelligent tutoring systems provide improved accessibility by offering learning experiences resulting from interaction with the student as constructed in the successful inclusive program approach across students with different abilities and backgrounds. Content dedicated delivery makes education inclusive and equitable; hence each student gets a fair chance to succeed. Personalized learning engenders the provision of self-directed living habits in students whereby they view and approach topics of interest on their own with the help of an adaptive guide. Acquired skills are in critical thinking, problem resolution, and independent research, geared toward enhancing them for success in both theoretical and real-world settings. Our ultimate goal is a transformation in education so as to avail a system that is student-centric, adaptable, and results-oriented. With machine learning, Gen-AI, and personalized tutoring combined into one approach, we can build a comprehensive learning ecosystem where students can reach their full potential, enhancing understanding, improving performance, and creating a lifelong love of learning.

IV. SCOPE OF PROJECT

An AI e-learning platform for students that delivers customized formats of educational content. It will be backed by LLMs for the generation of respective notes and explanations in various subjects. Learning has transformed as such in responding to the personalized pace and understanding of the student and regarding the need in academics.

A. *Some of the Features*

1) Personalized Note Configuration: Generation of personalized academic notes with content level adjustments to be based on the user's knowledge level. Highly adaptive learning.
2) Interactive Chat Interface: Easy and user-friendly chatbot interface made easy with HTML, CSS, and JavaScript that facilitates students interacting freely with the AI. Switchable Modes of Display: Light and dark modes.

3) Backend Copied and Integrated with AI: The backend processes the user input through and returns the satisfactory yet relevant responses in real-time. Adaptive Learning Support: It customizes responses to the individual needs in conjunction with promoting better engagement and understanding.
4) Limitations and Challenges: Range of subjects: Initially covers core subjects like science for middle and high schools. Expansion on other subjects in the future.
5) Internet Dependency: AI offers its services through cloud-based models, which means that stable connectivity is essential.
6) Data Privacy and Security: The program will be based on ethical data use policies and have constant improvements made towards data protection.

B. *Future Expected Enhancements*

1) Further Diversified Subject Areas: The inclusion of further topics and specialized content.
2) Multilingual Note Generation: Generation of notes in different languages.
3) Voice Input: In-built voice commands for more accessibility.

V. LITERATURE REVIEW

In the last decade, Artificial Intelligence (AI) witnessed great advancement across many sectors, with education standing high as one of its transformative fields.

AI has accelerated the birth of intelligent learning systems in education, thereby making the e-learning platforms capable of providing educating, customized, and interactive teaching. Through the application of artificial intelligence in education, the systems have learned to shift from closed educational experiences that cater to a general user base toward experiences that promote personalization contextual to the learner. This literature review delves into the development and research in AI-based e-learning, concentrating on personalized learning, the role of large language models (LLMs), the part chatbots play in creating the educational tools that function on AI so far.

A. *Attuning AI in Attentive Learning Interest*

The concept of personalized learning has existed in education for a long time, focusing on molding content, pace, and teaching according to the individual needs of each student. Pane et al. (2017) describe personalized learning as adjusting instruction into individual student's strengths, weaknesses, and preferences targeted towards improved learning outcomes. The traditional adaptive learning systems that attempted were then more rigid. They would modify the content based on performance but would have inflexibly followed some rule-based algorithm, with little or no real- time flexibility. With the advent of AI and machine learning, the field of learning has moved forward in leaps and bounds in making learning personalized. AI-driven systems make dynamic and timely restrictions to learning pathways by analyzing huge amounts of data-from students performance, behavior patterns, last but not least, engagement levels, according to Luckin et al. (2016) . They can notice when a learner is struggling and recommend resources or change the difficulty of tasks. It is also useful in developing intelligent tutoring system that uses models of reinforcement learning that have been found to be important in optimizing the learning process so that learners are always stretched but not swamped.

B. *Content Generation through Large Language Models (LLMs)*

Consider the distance between LLMs and the way content is generated within educational contexts. OpenAI has some good examples such as GPT-4 and Google's Gemini: both models can generate coherent human-like language responses based on that huge training data.

Such developments have made it impossible for Brown et al. (2020) not to recognize that these models are capable of generating meaningful text in context. More human-like text: The very creation of artificial intelligence, especially machine learning, has paved the ground for learning to evolve into a field that has gone at some pace towards being personalized. According to Luckin et al. (2016) ,

AI systems usually analyze huge datasets-from student performance and behavior patterns to engagement levels-and make dynamic and timely changes to learning pathways according to that data. It may see when a learner is struggling and suggest useful resources or adjust task difficulty levels. Also, the reinforcement learning models are leveraged to create intelligent tutor types who will allow the learning processes to be optimized, stretching learners' abilities without overwhelming them.

C. Content Generation through Large Language Models (LLMs)

The distance between LLMs and the way content is produced in educational contexts is considerable. OpenAI presents its large language models GPT-4 and Google Gemini, for example, as able to produce coherent, human-like language responses based on all that huge training data. Such developments have made it impossible for Brown et al. (2020) not to recognize that these models can generate meaningful text in context. E-learning refers to the use of LLMs in the preparation of custom learning materials such as simplified detailed explanations, personalized study guides, quizzes, and flashcards. Most students can receive content on demand and tailor it to the needs of questions or gaps in understanding. This responsive nature eliminates the need for static textbooks or pre-recorded lessons, adaptable, and interactive education. It also provides multilingual learning and supports learners from varied linguistic backgrounds through rich, accurate translations and contextually culturally friendly content.

Another application of AI in learning is through chatbots. This application allows one to use artificial intelligence in both online and blended learning. Such agents replicate human conversations and provide quick assistance while improving student engagement and learning on their own. "Why not include the feedback messages from a chatbot in a theoretical model that leads from learning to dropout?" said Winkler and Söllner (2018). ølstad and Brandtzæg (2017) assert even further the advantages of applying conversational interfaces to education by observing the positive impact on usability. The chatbots present in learning management systems or educational apps can lead students through course material, give encouragement and aid in other repetitive activities like scheduling or tracking progress. Their availability. Great practical examples of AI-Enabled Educational Tools: Some of the very latest e-learning platforms have now almost perfected the use of artificial intelligence in education delivery. Adaptive learning technologies such as those provided by DreamBox and Carnegie Learning personalize and customize mathematics instruction according to students' needs. These tools keep continuously assess and adapt learning difficulty and methods of instruction based on real-time performance of the learner. Same with popular Duolingo language instructional program source, wherein most of his AI personalization is embedding into the instruction. The system analyzes user progress through the algorithms behind it and automatically shifts to deficient areas while gamifying it. The reply is evaluated using natural language processing, both written and spoken activities included, adding more magic to it.

However, most of the current AI educational programs are still being designed in terms of specific domains like mathematics or language learning and do not have much flexibility to be used for general education. The more general applications of AI in education are still developing, as are the challenges related to accuracy of contents, alignment with instruction, and ethical use of learner data. According to this, it will be pivotal for developers, educators, and policymakers to work hand in hand so that the AI-based tools will not only be able to improve the learning outcomes but also be in coherence with the curricular goals for such equity in educational access.

VI. METHODOLOGY

It is this section which describes the forms, types, and methods systematically followed in the design, development, and implementation of the AI-enabled intelligent e-learning system capable of customizing personalized academic notes. That way, the overall methodology adopts a typical structure, which contains the whole system architecture, frontend and backend development, AI model integration, data processing, and user interaction mechanisms as one. All the parts together ensure the delivery of relevant, in-context, grade-appropriate learning content to students.

A. System Design and Architecture

The architecture of the system is a modular architecture system built on three main components, namely a frontend user interface, a backend server, and an inbuilt big language model, LLM for AI-generated content. This architecture thus is intended to allow the user and the AI engine to communicate seamlessly, keeping the decoupled nature of the core components. Every module is scalable, reusable, and thus optimized for performance and responsiveness.

B. Frontend User Interface

The frontend acts as the main interaction point of the learners with the system. It is built on standard web technologies - HTML, CSS, and JavaScript. The interface simulates a chatbot-like experience where a user can ask questions, request academic notes, and converse largely in educational queries. To make the experience user-friendly and accessible, the interface comprises essential usability features; it is responsive, with clearly readable typefaces and easy navigation. Users are allowed to toggle between light and dark modes to suit their preferences and reduce eye strain in different light conditions.

C. Backend Server Integration

In charge of the complete business logic, the backend performs activities such as user input and then communication with the AI model followed by sending it to the response formatter for delivering the response.

The backend has been created with any of the server-side frameworks like Flask or Node.js and has allowed the handling of asynchronic API calls in order for the solutions to user interaction to be efficient. Once a student submits a question or topic via the interface of the chatbot, that question or topic will be processed by the backend and transformed into standard formats and pushed to the AI model.

When the AI model processes the input through it, the AI-generated content is sent back through the backend to the frontend for presentation.

Logging and error-handling functions are available on the backend. That makes it robust and also fault-tolerant. In addition, many pieces of session data are stored that can be used for ongoing interaction tracking and bringing up personalized content based on previous input.

D. AI Model Integration (Large Language Model)

The heart of this system is its AI engine powered by a large language model (LLM), for example, Google Gemini. This model can comprehend and interpret natural language queries and produce responses that sound fluent and human-like. The model has been fine-tuned toward an academic setting, where it is guided through prompt engineering for the output to be tailored to the user's level of study and academic subject matter.

The AI model is accessed via an API, wherein, for each request, user input is concatenated with a system prompt that instructs the model on expected behavior. The model can also personalize its responses, varying tone, depth, and complexity per an individual user's educational needs.

E. Creation of the Request and Processing of the Data

Prompt engineering is basically at the centre of the methodology since it decides how good and relevant AI-generated content is. This means creating prompts that include both user-level information (for example, the topic and grade level) and system-level instructions for the AI (which cover traits such as tone, scope, and constraints). This way, users can be assured that LLM gives correct, age-appropriate, and pedagogically sound answers.

Upon receiving a query by the end-user, the backend enriches it with some metadata such as subject type, complexity type, and length of any desired reply.

These variables will be incorporated into the prompt being sent to the AI model. The system prompt will be tailored to further instruct the model to act as a helpful tutor by ensuring clear and concise explanations, avoiding unnecessary jargon, and providing notes in a structured and easy-to-understand manner.

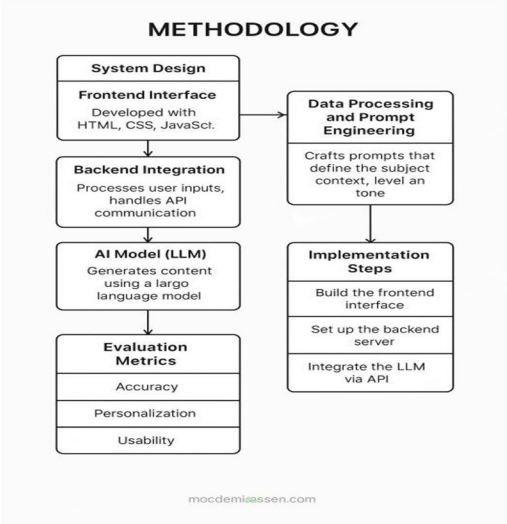
Mechanisms for sanitizing user input, verifying topic relevance, and resolving ambiguous queries are also contained in the data-processing pipeline. Any queries that have insufficient context could therefore result in a system prompt to elicit more context from the user before passing this input to the model. This iterative refinement will help in cutting down on errors and improving the overall learning experience.

F. User Interaction Workflow

The workflow commences by any user writing a question or a topic in the interface. The input gets captured on the frontend and is sent to the backend.

Here the backend processes the input, generates all the necessary prompt engineering rules, and forwards an all-encompassing prompt to the LLM. After generating the content, the backend processes the response to give it clarity and coherence before sending it back to the frontend for display purposes.

The system is designed to support memories of user preferences and past queries over sessions for personalized learning paths. Such would allow the AI to build context and coherent responses over time like a long-term student- teacher interaction.



VII. RESULTS AND DISCUSSIONS

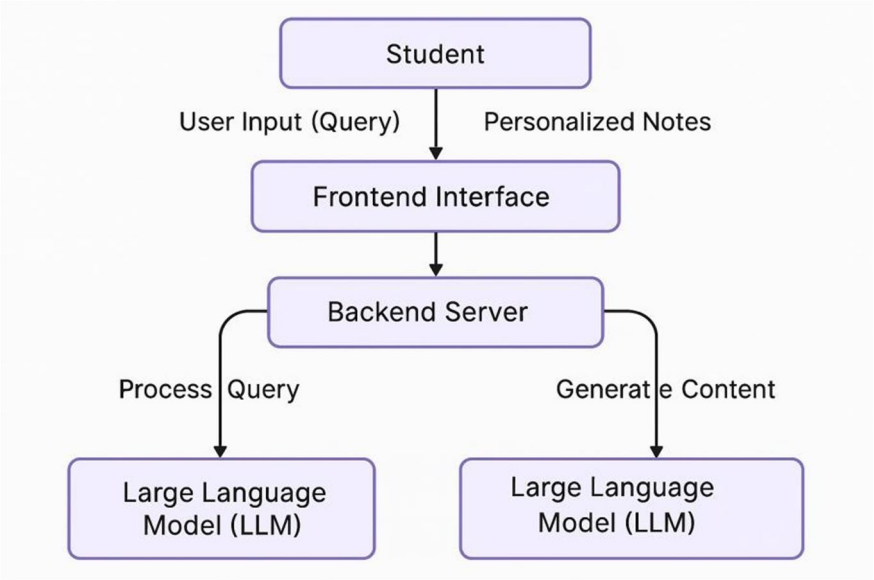
A. *Results*

Preliminary results of our Intelligent Tutoring System show the following:

1) Enhanced learning performance: Users of a personalized-note-and-recommendation-enabled intelligent tutoring system had statistically greater academic uplift than stereotypically exposed cohorts.

2) More User Engagement: Personalized delivery increased user engagement, where users express appreciation for the relevance and effectiveness of what is provided.

3) Using Study Time Spent Well: Time reported better consumption of study time through personalized suggestions, concentrating on areas needing improvement.

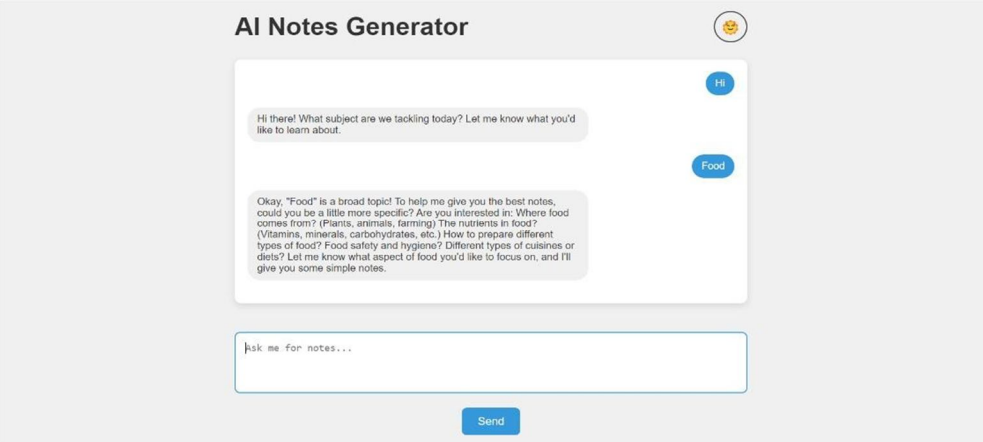


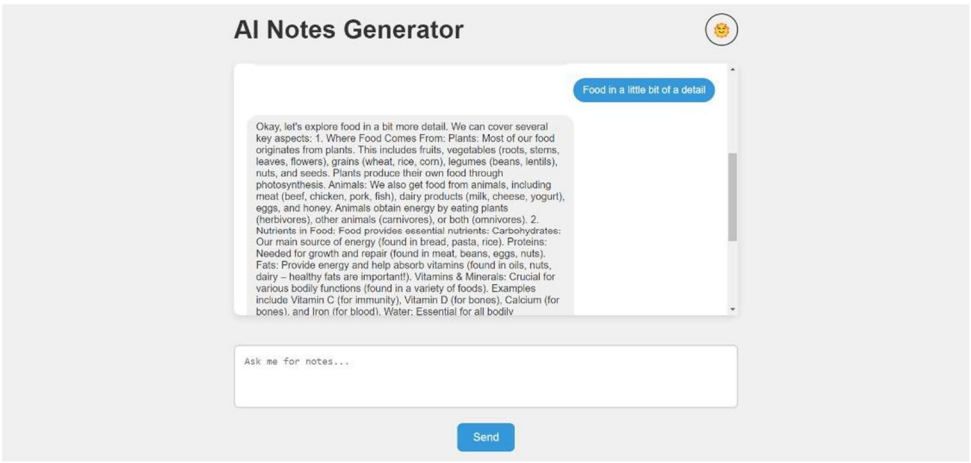
B. *Discussions*

Even so, there is much future exploratory work and improvement to be done:

1) Improvement of Machine Learning Algorithms: Constant continued improvement of machine learning algorithms would be essential for realizing the kind of precision and depth analysis of the data that should be considered possible. It can offer very accurate, adaptive, and personalized recommendations when there is a better understanding of user behavior, preferences, and learning patterns. Such a process, which evolves with the user progress, would ensure that the system is dynamic and effective in support.

2) Extending Generative AI Capabilities: There is room to extend the capacity of the generative AI to produce even more contextually specific personalized educational materials. When such a tool is tailor-made to fit the diverse needs of the learner across varying subjects, it ensures that the recommendation and the resources available closely align with the specific learning context and ultimately improves the relevance and implications of the material.





VIII. CONCLUSION AND FUTURE WORKS

The creation of an artificial intelligence-based e-learning tool capable of producing personalized academic notes showcase the tremendous possibilities that technology opens up in learning. The combination of a chatbot interface with a Large Language Model provides customized learning materials suited to students' different expressions of their needs. The first results reveal the effectiveness of this system in improving learning, increasing user engagement, and improving study time utilization. The results reinforce the importance of personalized learning approaches in promoting better academic performance and in enabling effective learning experiences.

This system is only a step toward what all-adaptive and intelligent tutoring systems would look like. Data privacy, algorithmic bias, and much of the highly specialized content still need to be created, all of which remain to be pursued further. However, the present project aims to create a base for future advances in personalized education with the ever-increasing advancements in AI technology.

Research can be continued along several lines which will certainly augment the present system's capabilities:

1) The Advanced Personalization Technologies: Future works will concentrate on optimizing machine learning algorithms to create increasingly accurate and dynamic personalized content-from improving student knowledge models to better capturing their learning preferences-all the way through developing content.
2) Multimodal Content Generation: The more diversified and numerous forms of content the system would produce, such as quizzes and diagrams, and media forms, will also embrace the multiply enriching learning experience, adapting to different learning styles. Cross Subject and Multilingual Support: The better the model could be able to adapt to other subjects and languages, the more it would benefit different learners-to be the real true versatile education tool.

3) Improved user feedback incorporation: Thus, creating robust feedback loop within which the users shall generate interfaces that will gather continuous user feedback and thus ensure iterative improvement informed by real-world usage and learner needs.

4) Data Privacy and Ethical Considerations: The focus would still lie in stepping up data protection measures and removing the bias from content generation. The future would include embedding ethical frameworks in AI that will promote fairness, inclusiveness, and security.

IX. ACKNOWLEDGMENT

We would like to express our deepest gratitude towards Prof. Krishnadas Saha, our devoted supervisor, whose guidance and encouragement have been the driving force behind carrying our research forward. His inspiration and leadership have been the driving force behind making this project feasible and enhancing our academic life to a great extent. Our path has been wisely and foresightedly led by Prof. Saha's precious ideas and suggestions for our professional life.

We would also like to express our profound gratitude to Prof. Moutushi Biswas Singh for always encouraging us to proceed without a series of obstacles we encountered along the way of the course. We would also like to thank all the technical, non- technical, and office personnel in our department for extending their support where needed. We would also like to thank all our depart- mental colleagues for ensuring a welcoming working environment to complete our project work. We would also like to thank our director, Prof. Satyajit Chakraborti, for offering us such a great platform to build our scholarly lives. We also have a very special position in our hearts for our Principal, Prof. Arun Kumar Bar, because he has inspired us throughout.
