AI-Powered Legal Contract Risk Analyzer

K. Durga Pavan Gangadhar¹, G. Sai Vardhan², P. Kalyani³, A. Sai Kiran⁴, Ms. V. Jahnavi⁵
Department of Electronics and Communication Engineering, Sasi Institute of Technology and Engineering

Abstract: *Legal contract analysis is a critical process that requires significant time, expertise, and attention to detail. Traditional manual methods are often slow, inconsistent, and prone to human error. This paper presents an AI-powered legal contract risk analyzer that automates the identification and classification of risks in legal documents. The proposed system leverages the advanced capabilities of Gemini Flash 2.5 to extract, analyze, and interpret contractual clauses. It classifies risks into high, medium, and low categories, enabling users to quickly understand potential issues within a contract. The system also provides recommendations for risk mitigation and ensures improved accuracy and consistency compared to traditional approaches. Experimental results demonstrate that the proposed solution significantly reduces analysis time while maintaining reliable performance. This work highlights the potential of AI in transforming legal document analysis and enhancing decision-making processes.*

Keywords: *Artificial Intelligence (AI), Natural Language Processing (NLP), Legal Contract Analysis, Risk Classification, Machine Learning, Document Analysis, Gemini Flash 2.5.*

I. INTRODUCTION

Legal contracts are essential documents that define the rights and obligations of parties in various domains such as business and services. These documents often contain complex legal language and detailed clauses, making their analysis difficult and time-consuming. Traditional contract review is performed manually by legal experts, which requires significant effort and is prone to human error and inconsistency, especially when handling large volumes of documents.

With the advancement of Artificial Intelligence (AI) and Natural Language Processing (NLP), automated systems can now assist in analyzing legal documents more efficiently. This paper presents an AI-powered legal contract risk analyzer that utilizes NLP techniques and the capabilities of Gemini Flash 2.5 to process and interpret contract text.

The proposed system identifies important clauses and classifies them into high, medium, and low risk categories. By automating risk detection, the system reduces manual effort, improves accuracy, and ensures consistent analysis. Additionally, it provides recommendations to help users mitigate potential risks and make informed decisions.

The objective of this work is to develop an efficient and scalable solution for contract risk analysis, demonstrating the potential of AI in enhancing legal document processing.

II. LITERATURE SURVEY

According to recent research, it has been seen that Artificial Intelligence and NLP provide a great help in analyzing contracts as they help in extracting, summarizing, and identifying risks. According to research, the use of transformer models and LLMs plays an effective role in improving the process. Existing models do not consider the category of risks and any real-time suggestion to mitigate them. This problem is solved by the proposed system based on Gemini Flash 2.5[1]. examine the role of AI in transforming contract analysis and legal research. The study highlights that AI improves automation, efficiency, and accuracy in processing large legal documents. It concludes that while AI enhances legal workflows, human oversight and ethical considerations are essential for reliable outcomes[2]. focus on automating legal compliance and contract management using advanced data analytics techniques. The study highlights improvements in risk assessment, regulatory adherence, and negotiation optimization through intelligent systems. It concludes that such approaches enhance efficiency and decision-making, while emphasizing the need for high-quality data and system reliability[3]. provides a critical analysis of AI-powered contracts, examining their impact on legal interpretation and automation. The study highlights that AI improves efficiency, contract processing, and risk identification, but raises concerns about transparency and legal validity. It concludes that while AI enhances contract analysis, human judgment and regulatory frameworks are essential to ensure reliability and fairness[4]. examines the risks associated with contracting AI systems in legal environments. The study highlights challenges such as system errors, accountability issues, and reliability concerns in AI-driven contracts. It concludes that effective risk management strategies and human oversight are essential to ensure safe and trustworthy use of AI in legal applications[5].

Explores the application of AI in legal research, contract analysis, and decision-making. The study highlights that AI systems can automatically analyze contracts, extract key information, and support legal decisions efficiently. It concludes that AI improves speed, accuracy, and productivity, while emphasizing the need for human validation in critical legal processes[6]. propose an automated risk analysis approach for construction contracts using neural networks. The study demonstrates that AI models can effectively identify and predict contract risks, improving accuracy and reducing manual effort. It concludes that neural network-based systems enhance risk assessment and decision-making, though proper training data and validation are essential for reliable results.[7].) explores the application of AI in legal analytics, focusing on contract analysis and predictive decision-making. The study highlights that AI improves efficiency, accuracy, and data-driven insights in legal processes. It concludes that maintaining ethical standards and human oversight is crucial to ensure fair and reliable outcomes[8]. Discusses the use of AI as a tool for managing contracts, focusing on its practical applications and challenges. The study highlights that AI improves contract management, efficiency, and automation, but also introduces issues related to legal interpretation and accountability. It concludes that successful adoption requires proper regulation, transparency, and human oversight to ensure reliable outcomes[9]. examine the use of AI in legal systems to determine employee vs. independent contractor status. The study highlights that AI can analyze legal criteria, classify employment relationships, and support decision-making efficiently. It concludes that AI improves consistency and accuracy, but requires careful validation to ensure fairness and compliance with legal standards[10]. compares AI-based contract review with traditional manual review methods. The study highlights that AI enables faster processing, improved consistency, and more effective risk identification, while manual review is slower and prone to human error. It concludes that a hybrid approach combining AI and human expertise provides the most reliable and efficient solution for contract analysis[11]. propose the use of Artificial Intelligence for analyzing risks in legal documents to support better decision-making. The study demonstrates that AI techniques can identify potential risks and extract relevant legal information efficiently. It concludes that AI-based systems improve decision support and accuracy, though early models had limitations in handling complex legal language[12].

III. PROPOSED SYSTEMS

The proposed system is an AI-based legal contract risk analyzer that automates the identification and classification of risks in contracts. It uses Natural Language Processing (NLP) and machine learning models like Gemini Flash 2.5 to analyze contract text. Initially, the user uploads a legal contract, which is processed by the AI risk analysis engine. The system understands the content and identifies important clauses. It then classifies the risks into three categories: high risk, medium risk, and low risk based on severity

After classification, the system generates a detailed risk report and provides recommendations to reduce potential risks. It also performs compliance checks to ensure legal standards are met. A dashboard with realtime alerts helps users quickly identify critical issues.

Thus, the proposed system improves accuracy, reduces manual effort, and enables faster contract analysis.

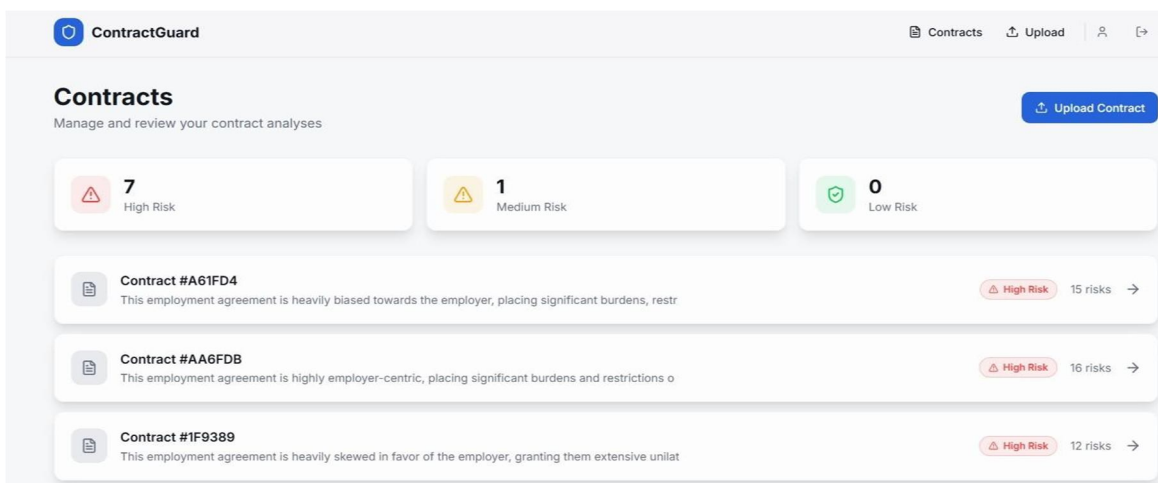

Figure 4: Dashboard

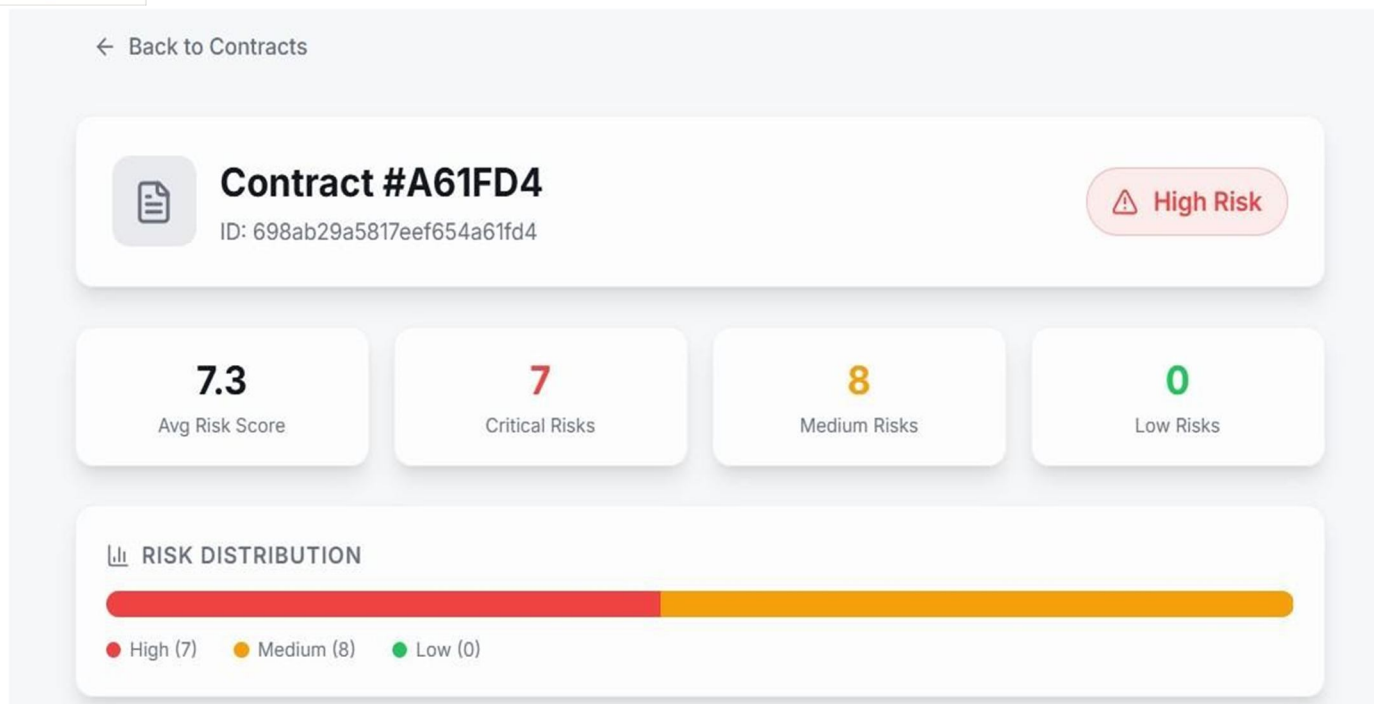

Figure 5: Result report

IV. WORKFLOW STEPS

- 1) The user uploads a legal contract document in formats such as PDF, DOC, or image.
- 2) The system extracts text from the document using OCR (if needed) and performs preprocessing such as cleaning, normalization, and formatting.
- 3) The processed text is analyzed using NLP techniques and advanced models like Gemini Flash 2.5 to understand legal clauses.
- 4) The system identifies critical clauses such as liability, indemnity, and termination conditions.
- 5) Identified clauses are categorized into High Risk, Medium Risk, and Low Risk based on severity.
- 6) A detailed risk analysis report is generated, including summaries and key findings.
- 7) The system provides suggestions and action steps to reduce or eliminate identified risks.
- 8) The contract is evaluated for legal compliance and potential conflicts.
- 9) Results are displayed through a dashboard with real-time alerts for high-risk issues.

V. RESULTS & DISCUSSIONS

- 1) The proposed AI-powered legal contract risk analyzer was evaluated using a set of sample legal documents containing various types of clauses, including liability, indemnity, and termination conditions. The system successfully processed contracts in different formats and demonstrated effective performance in extracting and analyzing textual content.
- 2) The results show that the system accurately classifies contract clauses into three categories: high risk, medium risk, and low risk. High-risk clauses, such as unlimited liability and ambiguous termination conditions, were correctly identified and flagged for immediate attention. Medium-risk clauses were marked for further review, while low-risk clauses were recognized as having minimal impact. This classification helps users quickly prioritize critical issues within contracts.
- 3) The integration of Natural Language Processing (NLP) techniques with advanced models like Gemini Flash 2.5 enabled improved contextual understanding of legal language. Compared to traditional manual review, the proposed system significantly reduced analysis time and ensured consistent results across multiple documents. The system also demonstrated scalability by efficiently handling multiple contracts without performance degradation.
- 4) In addition to classification, the system generated detailed risk reports and provided actionable recommendations for mitigating identified risks. The compliance and review module further enhanced the reliability of the system by checking adherence to legal standards.

- 5) However, some limitations were observed. The system may face challenges when dealing with highly complex or uncommon legal clauses that require deep domain expertise. Additionally, the accuracy of results depends on the quality of input data and preprocessing techniques.
- 6) Overall, the proposed system demonstrates that AI can effectively automate legal contract analysis, improving efficiency, accuracy, and decision-making in legal processes.

VI. FUTURE INSIGHTS

- 1) The proposed system can be enhanced by integrating advanced AI models like Gemini Flash 2.5 for better accuracy and understanding of legal language.
- 2) Future improvements include real-time contract assistance, where users get live suggestions while drafting contracts. The system can also support multiple languages for wider usability.
- 3) Implementing Explainable AI (XAI) will help users understand why a clause is classified as risky. Integration with legal databases can improve prediction accuracy.
- 4) Additionally, deploying the system on the cloud will make it scalable and accessible. Continuous learning from user feedback can further improve system performance over time.

VII. CONCLUSION

- 1) This paper presented an AI-powered legal contract risk analyzer that automates the process of analyzing and classifying risks in legal documents. The proposed system utilizes Natural Language Processing (NLP) techniques and advanced AI models such as Gemini Flash 2.5 to efficiently process contract text and identify potential risks.
- 2) The system successfully classifies contract clauses into high, medium, and low risk categories, enabling users to quickly understand critical issues and prioritize actions. Compared to traditional manual methods, the proposed approach significantly reduces analysis time, improves accuracy, and ensures consistency in results.
- 3) Additionally, the system provides detailed reports and recommendations for risk mitigation, enhancing decision-making and contract management processes. The integration of compliance checks further ensures adherence to legal standards.
- 4) Overall, the proposed solution demonstrates the effectiveness of AI in transforming legal document analysis and highlights its potential for real-world applications in law firms, businesses, and other organizations.
