# Breast Cancer Prediction in Python

Pratham Khubchandani<sup>1</sup>, Harshith Deeti<sup>2</sup>, Beeram Harsh<sup>3</sup>

<sup>1,2,3</sup>Department of Electronics and Computer Engineering, SNIST, Hyderabad, Telangana, India

**Abstract:** Breast maximum cancers is maximum cancers that office work withinside the cells of the breasts. After pores and pores and skin maximum cancers, breast maximum cancers is the most common location maximum cancers identified in girls withinside the United States. Breast maximum cancers can get up in every men and girls, but it's far more now no longer unusualplace in girls. Substantial resource for breast maximum cancers popularity and research funding has helped created advances withinside the evaluation and treatment of breast maximum cancers. Breast maximum cancers survival costs have increased, and the amount of deaths associated with this sickness is regularly declining, in big element due to factors along with earlier detection, a state-of-the-art custom designed approach to treatment and a better data of the sickness. Machine reading (ML) is a form of artificial intelligence (AI) allowing program application applications to emerge as more accurate at predicting results without the need of programmed to do so. Machine reading algorithms use anciental records as input to anticipate new output values.

**Keywords:** Breast Cancer, Python, Data Visualization, Machine Learning

## I. INTRODUCTION

Breast most cancers starts withinside the internal lining cells of the lobules of organ tissue. Malignant outbreaks are ab initio limited to the tubes or lobules and are usually much less seemingly to spread with few or no signs and symptoms. These degree 0 tumours develop over time, infiltrate the encompassing breast tissue (invasive most cancers), then to close to humour nodes (neighborhood metastases) or exceptional organs withinside the frame (remote metastases). it' attending to unfold. ladies die of carcinoma as a consequence of enormous metastases.

Treatment of carcinoma are regularly extraordinarily successful, especially if detected early. Microscopic willcer that has spread from a breast tumour thru the blood is usually handled with a combination of surgical resection, radiation, and drug remedy (hormonal remedy, chemotherapy, and / or focused organic remedy). This form of remedy can prevent the unfold and boom of the most cancers and keep lives. negligible paintings is being performed to broaden standards that suggest the precise temporal order of surgical treatment for sufferers with breast most cancers. that is regularly regularly notwithstanding the reality that, excluding degree I sufferers, the bigger the postpone from onset of signs and symptoms to identity or remedy, the much less seemingly it' to survive.

Patients with long-status signs and symptoms have large tumors and are within the overdue levels of the sickness.

Symptoms aside from lumps are associated with a decrease chance of survival for carcinoma sufferers. al even though the have a look at disagrees at the implications of delaying breast most cancers remedy, it can not be denied that the time among breast most cancers analysis and remedy are regularly extraordinarily unpleasant for ladies. Insomnia, temper disorders, melancholy and strain are called primary problems in surgical carcinoma sufferers. as soon as the surgery, the pressure and unhappiness eased. Therefore, every attempt ought to be created to reduce the ready time for surgical remedy.

Stage and tumour length of most cancers sufferers are important signs of sickness- unfastened survival and standard survival, accentuation the requirement for early detection and surgical remedy. exceptional essential prognostic elements encompass age, axillary node metastases, histopathological grade, excisional margins, and kinds of adjuvant remedy. Genetic variables are one among the maximum promising survival markers being studied

## II. PROPOSED ALGORITHM

### A. Flow Chart

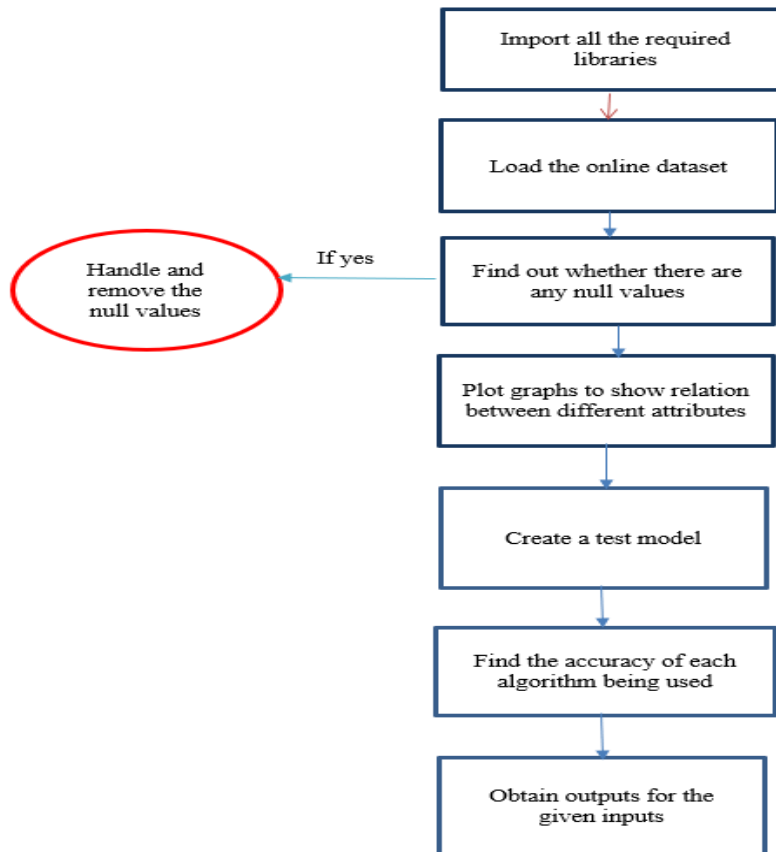

Figure 1. DWT Decomposition model

### B. Implementation of the Code

#### 1) Importing Python Libraries

```

import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
from sklearn.metrics import classification_report
from sklearn.metrics import accuracy_score
from sklearn.metrics import confusion_matrix
from sklearn.model_selection import train_test_split
from sklearn.model_selection import cross_val_score
from sklearn.model_selection import KFold
from sklearn.tree import DecisionTreeClassifier
from sklearn.neighbors import KNeighborsClassifier
from sklearn.naive_bayes import GaussianNB
from sklearn.pipeline import Pipeline
from sklearn.preprocessing import StandardScaler
from sklearn.model_selection import GridSearchCV
from sklearn.svm import SVC
from pandas.plotting import scatter_matrix
import seaborn as sns
%matplotlib inline
  
```

## 2) Importing Dataset

```
[ ] url = "https://archive.ics.uci.edu/ml/machine-learning-databases/breast-cancer-wisconsin/breast-cancer-wisconsin.data"
names = ['id', 'clump_thickness', 'uniform_cell_size', 'uniform_cell_shape', 'marginal_adhesion', 'single_epithelial_size', 'bare_nuclei', 'bland_chromatin', 'normal_nucleoli', 'mitoses', 'class']
df = pd.read_csv(url, names=names)
df.head()
```

|   | id      | clump_thickness | uniform_cell_size | uniform_cell_shape | marginal_adhesion | single_epithelial_size | bare_nuclei | bland_chromatin | normal_nucleoli | mitoses | class |
|---|---------|-----------------|-------------------|--------------------|-------------------|------------------------|-------------|-----------------|-----------------|---------|-------|
| 0 | 1000025 | 5               | 1                 | 1                  | 1                 | 2                      | 1           | 3               | 1               | 1       | 2     |
| 1 | 1002945 | 5               | 4                 | 4                  | 5                 | 7                      | 10          | 3               | 2               | 1       | 2     |
| 2 | 1015425 | 3               | 1                 | 1                  | 1                 | 2                      | 2           | 3               | 1               | 1       | 2     |
| 3 | 1016277 | 6               | 8                 | 8                  | 1                 | 3                      | 4           | 3               | 7               | 1       | 2     |
| 4 | 1017023 | 4               | 1                 | 1                  | 3                 | 2                      | 1           | 3               | 1               | 1       | 2     |

## 3) Creating a Test Model

Train\_test\_split in Sklearn model preference is a feature for splitting information arrays into subsets: for schooling data and for trying out data. With this selection, we don't need to divide the dataset manually. right here, Y is assigned great the cause variable "beauty" information and X is assigned all the extraordinary columns. The train and check gadgets are created the usage of the testsubstantial as 0.30 due to this 70% of rows are taken as teach facts and 30% of rows are taken into check facts and random u.s. of the usa of the united states will determine the splitting of facts.

```
[ ] Y = df['class'].values
X = df.drop('class', axis=1).values

X_train, X_test, Y_train, Y_test = train_test_split(X, Y, test_size = 0.30, random_state=21)
```

## 4) Checking the accuracy of algorithms already existing

```
# Testing Options
scoring = 'accuracy'
# Define models to train
models = []
models.append(('CART', DecisionTreeClassifier()))
models.append(('SVM', SVC()))
models.append(('NB', GaussianNB()))
models.append(('KNN', KNeighborsClassifier()))

# evaluate each model in turn
results = []
names = []

for name, model in models:
    kfold = KFold(n_splits=10)
    cv_results = cross_val_score(model, X_train, Y_train, cv=kfold, scoring=scoring)
    results.append(cv_results)
    names.append(name)
    msg = "For %s Model:Mean accuracy is %f (Std accuracy is %f)" % (name, cv_results.mean(), cv_results.std())
    print(msg)
```

```
For CART Model:Mean accuracy is 0.953019 (Std accuracy is 0.020455)
For SVM Model:Mean accuracy is 0.971386 (Std accuracy is 0.013512)
For NB Model:Mean accuracy is 0.963223 (Std accuracy is 0.025463)
For KNN Model:Mean accuracy is 0.971386 (Std accuracy is 0.016306)
```

5) Selecting Model

Since all algorithms are giving >95% accuracy, we can go ahead with SVM.

```
[ ] clf = SVC()
    clf.fit(X_train, Y_train)
    accuracy = clf.score(X_test, Y_test)
    print("Test Accuracy:", accuracy)
    predict = clf.predict(X_test)
```

```
Test Accuracy: 0.9714285714285714
```

6) Obtaining an example output.

```
[ ] clf = SVC()
    clf.fit(X_train, Y_train)
    accuracy = clf.score(X_test, Y_test)
    print("Test Accuracy:", accuracy)
    predict = clf.predict(X_test)
```

```
Test Accuracy: 0.9714285714285714
```

The predicted output is 2 i.e., Benign.
