FINGO: A Smart AI-Based Personal Finance Management System

Priyanshi Yadav¹, Aarya Magade², Yash Shelke³, Supriya Pawar⁴

Department of Computer Science and Information Technology, Bharat College of Engineering, Maharashtra, India

Abstract: *The rapid expansion of digital payment systems, online banking, and cashless transactions has significantly increased the complexity of managing personal finances. Individuals often struggle to monitor their daily expenses, leading to poor budgeting, overspending, and lack of financial planning. Traditional financial management methods, such as manual record-keeping and spreadsheets, are inefficient, time-consuming, and prone to human error.*

This paper presents FINGO, an AI-powered personal finance management system designed to provide automated expense tracking, intelligent data analysis, and real-time financial insights. The system enables users to record transactions, categorize expenses, and visualize their financial data through interactive dashboards. Artificial intelligence techniques are incorporated to analyze spending patterns and generate personalized budgeting recommendations.

The system is developed using modern web technologies, including React.js for frontend development, Django for backend processing, and SQLite for database management. Performance evaluation indicates that the system provides accurate expense categorization, efficient processing, and improved financial awareness among users.

The proposed solution reduces manual effort, enhances financial discipline, and supports users in making informed financial decisions, thereby contributing to the advancement of financial technology systems.

Keywords: *Artificial Intelligence, Personal Finance, Expense Tracking, Budgeting, FinTech, Data Analytics, Financial Management.*

I. INTRODUCTION

In today's digital era, financial transactions have become increasingly frequent due to the widespread adoption of online payment platforms, mobile wallets, and banking applications. While these technologies have improved convenience, they have also made personal financial management more complex. Many individuals fail to keep track of their expenses, resulting in poor budgeting and reduced savings. Traditional methods such as maintaining notebooks or spreadsheets require continuous manual input and lack automation. These approaches are not only time-consuming but also fail to provide meaningful insights into financial behavior. Existing financial applications offer basic functionalities such as expense recording and categorization; however, they often lack intelligent analysis, predictive capabilities, and user-friendly interfaces. With advancements in Artificial Intelligence and Data Analytics, there is an opportunity to develop smarter systems that can automate financial management tasks. AI-based systems can analyze user behavior, identify spending patterns, and provide personalized recommendations to improve financial planning. FINGO is proposed as an intelligent personal finance management system that integrates automation, real-time analytics, and AI-driven insights. The system is designed to simplify expense tracking, enhance financial awareness, and support users in achieving their financial goals. By combining modern web technologies with intelligent algorithms, FINGO provides a comprehensive and efficient solution for personal finance management.

II. LITERATURE SURVEY

Recent developments in financial technology have led to the creation of various systems aimed at improving personal finance management. Several studies have focused on AI-based financial recommendation systems, which provide personalized suggestions based on user behavior. These systems enhance user engagement but require large datasets for accurate predictions. Expense tracking applications have also gained popularity. These applications allow users to record transactions and categorize expenses. However, most of them depend on manual input and do not provide intelligent insights or predictive analysis. Data visualization tools are used to represent financial data in graphical formats such as charts and graphs. While these tools improve understanding, they do not offer automated decision-making support. Cloud-based financial systems provide scalability and remote access, but they may raise concerns related to data security and privacy. Predictive analytics systems attempt to forecast financial trends; however, they are often complex and not easily accessible to general users.

TABLE I
LITERATURE REVIEW SUMMARY

S.No	Research Paper Title	Description
1	AI-Based Personal Finance Management System Using Machine Learning (2023).	Provides personalized financial recommendations using AI algorithms.
2	Smart Expense Tracking Application Using Data Analytics (2022).	Tracks and categorizes user expenses with basic analytics.
3	Financial Data Visualization System for Budget Analysis (2021).	Uses charts and graphs to represent financial data.
4	Cloud-Based Personal Finance Management System (2022).	Provides scalable and accessible financial tracking solutions.
5	Predictive Analytics for Financial Forecasting Using AI (2023).	Uses machine learning models to predict future financial trends.

A. Comparative Analysis of Existing Systems

From the above studies, it is evident that existing financial management systems focus on specific functionalities:

- AI-based systems provide personalized financial recommendations but lack real-time expense tracking and user-friendly interfaces.
- Expense tracking applications allow users to record and categorize expenses but require manual input and lack intelligent insights.
- Data visualization systems present financial data through charts and graphs but do not provide predictive analysis or decision-making support.
- Cloud-based systems ensure scalability and accessibility but raise concerns regarding data security and privacy.

No existing system provides a fully integrated solution that combines automation, intelligent analysis, and real-time financial insights.

B. Limitations of Existing Work

The key limitations identified in previous research are:

- Lack of integration between expense tracking, AI analysis, and data visualization.
- High dependency on manual data entry in most financial applications.
- Limited predictive capabilities in traditional budgeting systems.
- Complexity in understanding financial data due to lack of intelligent insights.
- Absence of real-time personalized financial recommendations.

C. Research Gap

Based on the analysis, there is a clear need for a system that:

- Combines automated expense tracking, AI-based analysis, and data visualization.
- Provides real-time financial insights and predictive recommendations.
- Reduces manual effort through automation.
- Ensures scalability, security, and ease of use through a web-based platform.

D. Proposed Solution Advantage

To address these limitations, the proposed FINGO system integrates:

- AI-based financial analysis for personalized budgeting suggestions.
- Automated expense tracking and categorization.

- Interactive dashboards for visual representation of financial data.
- Real-time analytics to monitor and control spending.
- Secure and scalable web-based architecture for efficient financial management.

Unlike existing systems, FINGO provides a unified platform that combines automation, intelligence, and visualization, making personal finance management more **efficient, accurate, and user-friendly**.

III. METHODOLOGY

The FINGO system follows a modular and layered methodology to ensure scalability, efficiency, and seamless integration of Artificial Intelligence with financial data processing. The system is designed as a web-based platform that automates expense tracking while providing intelligent financial insights and recommendations.

A. System Architecture

The system adopts a three-tier architecture consisting of the following layers:

- **Presentation Layer:** This layer provides the user interface using modern web technologies such as React.js. It allows users to interact with the system, add expenses, view dashboards, analyze spending patterns, and receive financial recommendations. The interface is designed to be responsive, interactive, and easy to use.
- **Application Layer:** The backend is implemented using the Django framework, which handles business logic, request processing, and communication between system components. This layer manages user authentication, expense categorization, and integration of AI-based analysis modules.
- **Data Layer:** The database layer uses SQLite to store user information, transaction records, categorized expenses, and analytical results. It ensures secure, consistent, and efficient data management.

B. System Workflow

The workflow of the system is structured as follows:

User → Registration/Login → Dashboard → Add Expense → Expense Categorization → Data Processing → Financial Analysis → Visualization → AI Recommendation → Report Generation

In this workflow, users first authenticate themselves and access the dashboard. They can then record expenses, which are automatically categorized. The system processes this data to generate insights, displays it through visual dashboards, and provides intelligent recommendations.

C. AI-Based Analysis

The AI module plays a crucial role in analyzing financial data and generating meaningful insights.

- Analyzes user spending patterns over time
- Identifies unnecessary expenses and saving opportunities
- Generates personalized budgeting suggestions
- Predicts future spending trends based on past data
- Helps users make informed financial decisions

This module enhances financial awareness and supports better planning.

D. Data Processing

The data processing module is responsible for transforming raw financial data into useful information.

- Collects transaction data entered by the user
- Categorizes expenses into predefined categories (food, transport, bills, etc.)
- Performs statistical analysis on spending behavior
- Generates summaries such as daily, weekly, and monthly reports
- Prepares data for visualization in dashboards

This module ensures that users can clearly understand their financial activities.

E. Module-Based Design

The system is divided into multiple functional modules to improve efficiency and maintainability:

- User Module: Handles registration, login, and profile management
- Expense Module: Manages expense recording and categorization
- Analysis Module: Processes financial data and generates insights
- Visualization Module: Displays charts and dashboards
- AI Module: Provides intelligent recommendations

Each module operates independently while maintaining integration with the overall system.

F. Advantages of Methodology

The proposed methodology offers several advantages:

- Automated expense tracking reduces manual effort
- Real-time financial insights improve decision-making
- AI-based recommendations enhance financial planning
- Modular design ensures scalability and flexibility
- Efficient data processing ensures accuracy and reliability
- User-friendly interface improves accessibility for all users

Overall, the methodology ensures that the FINGO system delivers a comprehensive, intelligent, and efficient solution for personal finance management.

IV. SYSTEM DESIGN AND IMPLEMENTATION

The FINGO system is designed as a scalable and modular web-based application that integrates modern web technologies with intelligent data processing. The system architecture ensures efficient performance, secure data handling, and a user-friendly experience.

A. System Design

The system follows a client-server architecture, which separates the user interface from the backend processing. This design improves scalability, maintainability, and performance.

- Frontend Layer: The frontend is developed using React.js, which provides a dynamic and interactive user interface. It allows users to easily navigate through different features such as expense entry, dashboard visualization, and financial analysis. The interface is responsive and designed to enhance user experience.
- Backend Layer: The backend is implemented using Django, a powerful Python framework. It handles business logic, user authentication, data processing, and communication between the frontend and the database. The backend ensures efficient request handling and secure data transactions.
- Database Layer: SQLite is used as the database for storing user data, transaction records, categorized expenses, and analysis results. It provides a lightweight and efficient solution for data storage and retrieval.

The system design ensures smooth interaction between all components while maintaining high performance and reliability.

B. Data Flow

The system follows a structured data flow process to ensure efficient handling of user data:

User Input → Frontend Interface → Backend Processing → Database Storage → Data Analysis → Visualization → Output Display

- Users enter financial data through the interface
- The frontend sends requests to the backend via APIs
- The backend processes the data and stores it in the database
- Analytical operations are performed on stored data
- Results are displayed to users in the form of dashboards and reports

This structured data flow ensures accuracy, efficiency, and real-time updates.

C. Technologies Used

The system is implemented using modern technologies to ensure performance and scalability:

- Frontend: React.js for building dynamic user interfaces
- Backend: Django framework for handling server-side logic

- Database: SQLite for storing financial data
- APIs: RESTful APIs for communication between frontend and backend
- Development Tools: Visual Studio Code and GitHub for development and version control

These technologies ensure that the system is efficient, secure, and easy to maintain.

D. Implementation

The implementation of FINGO focuses on integrating different system components seamlessly.

- RESTful APIs are used to enable communication between frontend and backend
- User authentication is implemented to ensure secure access
- Expense data is validated before storing in the database
- Data processing algorithms are used to categorize and analyze expenses
- Real-time updates are provided to users through dynamic dashboards

Security measures such as data validation, authentication, and controlled access are implemented to protect user information.

E. Features

- Expense tracking and categorization.
- Budget analysis and prediction.
- Dashboard visualization.
- Secure authentication extend it.

F. Advantages of System Design and Implementation

The proposed system offers several advantages:

- Efficient and scalable architecture
- Secure and reliable data handling
- Easy integration of additional features
- Improved user experience through interactive interface
- Accurate financial tracking and analysis

Overall, the system design and implementation ensure that FINGO provides a robust, efficient, and intelligent solution for personal finance management.

V. RESULTS AND DISCUSSION

The FINGO system was developed and tested under various real-world scenarios to evaluate its performance, accuracy, and usability. The system was tested with multiple users and different types of financial data to ensure reliability and consistency. The results indicate that the system performs efficiently and provides meaningful financial insights.

A. Performance Analysis

The performance of the system was evaluated based on response time, processing speed, and system stability.

- The system demonstrated fast response time for user requests such as adding expenses and viewing reports.
- Backend processing was efficient due to optimized data handling using Django.
- The system maintained stability even with multiple transactions.
- Real-time updates were successfully reflected on the dashboard without delays.

Overall, the system ensures smooth operation and efficient performance.

B. Accuracy

Accuracy was measured based on the correctness of expense categorization and data analysis.

- The system achieved high accuracy in categorizing expenses into predefined categories.
- Financial summaries such as daily, weekly, and monthly reports were generated correctly.
- AI-based suggestions were relevant and helpful based on user spending patterns.
- Minimal errors were observed during testing.

C. User Experience

User experience was evaluated based on usability, interface design, and ease of navigation.

- The interface was found to be simple, intuitive, and user-friendly.
- Users were able to easily add and manage expenses.
- Dashboard visualization helped users understand financial data clearly.
- The system required minimal learning effort for new users.

Overall, users found the system effective and convenient for managing finances.

D. Benefits

- Increased financial awareness.
- Reduced manual effort.
- Better budgeting decisions.

E. Limitations

- Requires internet connectivity.
- Limited prediction accuracy for complex data.

VI. CONCLUSION

FINGO is an intelligent AI-based personal finance management system that simplifies expense tracking and enhances financial decision-making. The system effectively integrates automation, real-time analytics, and data visualization to provide a comprehensive financial management solution.

The results demonstrate that FINGO improves financial awareness, reduces manual effort, and helps users make better budgeting decisions. The system provides accurate expense tracking, efficient performance, and a user-friendly interface.

With future enhancements such as AI-based financial advisors, mobile integration, and banking API connectivity, FINGO has the potential to become a powerful and widely used solution in the FinTech domain. The project highlights the importance of integrating modern technologies with financial management to improve user experience and financial stability.
