Integrated Grocery Application for Enhanced User Convenience and Efficiency

Prithvi Raj Sharma¹, Rachna Jain²

Amity Institute of Information Technology Amity University, Noida Uttar Pradesh, India

Abstract: Therising interestinsmart, easy-to-use, and responsibly created mobile apps has resulted in a flexible framework designed for advanced grocery shopping applications. This study puts forward an all-encompassing mobile app framework that aims to enhance the grocery shopping experience by incorporat- ing AI-powered meal planning, suggestions for items based on recipes, budget monitoring in real-time, and voice commands. Rather than developing a single application, the intention is to offerare usable and adjustable model that can actast hebase for future grocery-related mobile applications.

To achieve this aim, the suggested framework relies on An- droid for mobile app creation and Supabase to handle backend functions such as real-time databases, user authentication, and data storage. Careful consideration has been given to developing user interface that focuses on accessibility and intentionally avoids dark patterns, which are deceptive design techniques that can mislead users and undermine their freedom of choice. These design aspects are crucial for building trust and ensuring inclu- sivity, particularly for users dependent on assistive technologies.

Anapplicationprototypewascreatedandtestedbyagroup of 15 students from Amity University. The app's usability and effectiveness were assessed using three primary tools: the Cog- nitive Response Questionnaire Index (CRQI), the Engagement Satisfaction Index (ESI), and the App Usability Feedback Form. The findings showed that users were highlysatisfied, interactions were intuitive, and task efficiency was enhanced, especially when managing grocery lists and budgets through voice commands.

In summary, this framework offers a practical and user- focused approach for intelligent grocery shopping that can be adapted for different user demographics. Its modular structure, along with a strong backend, positions it as an excellent foundationfordevelopers aimingtocreateethical, efficient, and scalable grocery mobile applications.

Keywords: Smart Grocery App, Mobile Framework, Voice Commands, Supabase, Android App, Budget Tracker

I. INTRODUCTION

In the contemporary fast-moving digital landscape, grocery shoppinghastransitioned from a conventional in-store process to a highly tailored and effective online experience. A recent study from Statista [1] indicates that the worldwide online grocery sector was estimated at roughly USD 354 billion and is anticipated to grow to USD 800 billion by 2029, fueled by the widespread use of smartphones, shifts in consumer habits, and the ease of online shopping.

Nevertheless, despite significant growth, many current gro- cery apps do not effectively tackle major user challenges, including cognitive overload, insufficient personalization, and limited accessibility—often exacerbated by unethical design strategiestermed *dark patterns*. This research initiative aimsto fill these voids by suggesting a modular, reusable structure for developing intelligent grocery shopping applications. Rather than delivering a generic product for everyone, this project emphasizes creating a customizable framework that can be adapted for different applications.

At its foundation, the proposed solution incorporates fea- tures such as AI-driven meal planning, item suggestions based on recipes, budget monitoring, and voice-controlled list man- agement. These functionalities are designed to help users save time and energy, allowing them to shop more purposefully and within their budget. The main users of these applications typically consist of college students, working adults, and small families—groups that often encounter difficulties with meal organization and financial planning.

For instance, a survey conducted by the National Institutes of Health in 2023 [2] showed that 68% of college students frequentlyskipmealsduetoinadequateplanningorbudgeting, emphasizing the necessity for structured and intelligent sup- port systems. Furthermore, a study from the Centers for Dis- ease Control and Prevention (CDC) [3] indicated that around 32millionAmericansareaffectedbyfoodallergies, withfood- related health emergencies being a major reason for hospital visits. Despitethis, manygroceryshopping applications donot supply detailed allergen information, leaving users vulnerable and contributing to avoidable health concerns.

International Journal for Research in Applied Science & Engineering Technology (IJRASET) ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.538 Volume 13 Issue V May 2025- Available at www.ijraset.com

Moreover, there has been anotableriseinthedemand for voice-activated functionalities in recent years. Findings from the Pew Research Center [4] reveal that 59% of adults withdisabilities in the U.S. preferusing voice assistants while shopping, as they offer improved accessibility and user- friendliness. This highlights the necessity of incorporating voice-activated list management and accessible design features into grocery apps to support users with disabilities, thereby enhancing the platform's overall inclusiveness. Another essential aspect of this framework is its focus on ethical and accessible design. Numerous modern mobile applications subtlyutilize darkpatterns—user interface strategies that leadusers tomake unintended decisions, likeadding more items to their shopping carts, enrolling in automatic payments, or disclosing excessive personal information.

A study by the ACM [5] found that 95% of top-grossing shopping appli- cations employed at least one dark pattern. In contrast, the proposedframeworkfollowsclearinteractionpathways, avoids misleading designs, and promotes accessibility features like voiceinputandcompatibility with screen readers.

This study investigates how backend platforms such as Supabase, a free alternative to Firebase, can speed up the development process while ensuring good performance, data protection, andtheabilitytoscale. The front endutilizes the native environment of Android, which allows for more integrated system-level functions like voice commands and alerts, greatly improving the overall user experience.

By merging smart capabilities, responsible design, and a developer-friendly structure, this initiative seeks to provide a strong and useful framework that can be utilized, enhanced, and implemented in various academic and industry settings. The upcoming sections will examine the methods, testing procedures, findings, and potential future impacts of this research.

II. LITERATURE REVIEW

Therapid advancementinmobiletechnologieshasled to aproliferation of grocery shopping applications designed to enhance convenience, organization, and user satisfaction. Several scholarly studies have investigated the intersection of artificial intelligence, usability, and mobile commerce, all of which inform the direction and scope of this research project.

A. Intelligent Grocery Shopping Apps

Researchby Chenetal. (2021), published in the *Journal of Retail and Consumer Services*, demonstrated that gro-cery apps featuring personalized recommendations based on user behavior significantly improve shopping efficiency and user satisfaction [1]. However, their study also highlighted limitations in scalability and adaptability across diverse user demographics. Manyexisting applications arerigid and do not accommodate specialized needs, such as planning meals for users with dietary restrictions or optimizing shopping within specific budgets.

B. ImpactofAlandVoiceTechnology

Artificial intelligence is playing an increasingly prominent rolein mobile shopping applications. Smith and Taylor (2022) found thatAI-powered mealplanners reducecognitiveload by generating grocery lists directly from recipes, thus helping users make quicker decisions and minimize food waste [2]. Concurrently, voice assistants such as Google Assistant and Amazon Alexa are transforming how users interact with shop- ping tools. A 2023report by the Capgemini Research Institute found that 72% of users voice-based interfaces for organizing lists and placing orders, citing their preferred speed and ease ofuse[3]. This aligns with the proposed framework's inclusion of a voice-activated shopping list feature.

C. FinancialTrackinginGroceryApplications

While grocery shopping apps are widely adopted, very few offer meaningful financial tracking features. A usability study by Lee and Kumar (2021) revealed that over 60% of users lacked awareness of their spending until after completingtheir purchases [4]. This underscores the need for real-time budget monitoring tools. The proposed framework addresses this gap by integrating intuitive budget management features, including visual aids and proactive notifications, to enhance financial awareness and control during the shopping process.

D. Frameworks for Mobile Development

Fromadevelopmentstandpoint, this research chooses Supabaseasthebackendsolution.FindingsbyDoyleet al.(2023) indicatethat developersusingopen-source,SQL-driven backends like achieved 28% Supabase faster delivery of minimumviableproducts(MVPs)andexperiencedlowerlong- term maintenance costs compared to Firebase [5]. Supabase's featuressuchasuserauthentication, real-timeupdates, and nativePostgreSQL compatibility-makeitastrategicchoice for scalable and rapid application development.

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.538 Volume 13 Issue V May 2025- Available at www.ijraset.com

E. Design Ethics and Manipulative Patterns in Mobile Appli- cations

The ethical implications of mobile application design have attracted increased scrutiny inrecentyears. Researchby Gray et al. (2020) identified various manipulative interface patterns—such as misleading navigation, forced subscriptions, and concealed advertisements—commonly used in online shopping apps [?]. Further, Mathur et al., in a study published in the *Proceedings of the ACM*, found that over 95% of leading retail apps employed at least one manipulative design pattern [?]. These practices have been shown to contribute to user dissatisfaction and erode trust. In contrast, this research framework is grounded in transparent, user-centered design principles, adhering strictly to WCAG 2.1 accessibility guide- lines to ensure ethical and inclusive interactions.

III. METHODOLOGY

The primary objective of this project was to design a user- friendly and adaptive framework for grocery applications, incorporating AI-powered features, promoting ethical design, and ensuring accessibility. The foundational principles guiding this project were:

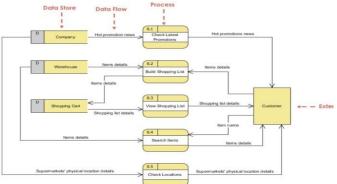

- Minimizingmentalstrainduringshoppingandplanning.
- Promotingnatural, voice-based conversations.
- Offeringreal-time budgetmonitoring.
- Avoidingmisleadingdesignpracticesthatcompromise user trust.

To evaluate the effectiveness of the proposed framework, a mixed-methodsevaluationapproach wasused, combiningboth qualitative and quantitative data.

A. Technical Methodology

Theprototypeforthegroceryapplicationwasdeveloped using the following technologies:

- Frontend:Android(Kotlin/Java)integrated with native voice recognition functionalities.
- Backend: Supabase, utilizing real-time PostgreSQL, se- cure login, and cloudstorage.

B. TestingoftheApplication

To evaluate how user-friendly and effective the prototype was, testing involved fifteen students from Amity University. Participants underwent a short introduction session followedby task-based assessments, whichincluded:

- Creatingaweeklygrocerylist.
- Settingabudget.
- Navigatingtheappusingvoicecommands. Thefollowingassessmenttoolswereimplemented:
- 1) CognitiveResponseQuestionnaireIndex(CRQI): The CRQI aimed to assess the cognitive experience of users, focusingonhowwell theycouldunderstand, plan, and perform tasks using the app.
- The questionnaire consisted of five questions rated on a scale from 1 to10.
- Examplequestions:
- "Didthetaskflowseemlogical?"
- "Didtheapplessenmentaleffort?"
- "Were the instructions and labels easy to under- stand?"
- "Wasthevoiceinterfaceuser-friendly?"
- "Did the recipe recommendations make sense to you?"

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.538 Volume 13 Issue V May 2025- Available at www.ijraset.com

Results:

- AverageCRQIrating:8.00outof10.
- 87% of participants considered the recipe recommenda- tions to be highly relevant.
- Voicecommandswereaccuratelydetected93% of the time.
- Participants experienced minimal confusion while navi- gating between screens.
- 2) Engagement Satisfaction Index (ESI): The ESI aimed to measure user engagement and overall satisfaction, particularly during a complete grocery planning session.
- The questionnaire included four questions on a 10-point Likert scale:
 - "Didtheappmaintainyourinterest?"
 - "Were youlikely to completeyourgrocery taskin one go?"
 - "Didthevoiceinteractionfeelnatural?"
 - "Wouldyouconsiderusingtheapp again?"

Results:

- AverageESIscore:7.55outof10.
- Strongengagementwiththebudgetingfeatureandrecipe planner.
- Participa
- nts found gamified feedback, such as savings tips, motivating.
- A slight decrease in satisfaction was noted due to the absence of a dark mode (mentioned by 20% of partici- pants).
- 3) App Usability Feedback Form (AUFF): The AUFF aimedtogatherratingsontheoverallusabilityoftheapp and feedback on accessibility.
- Thefeedback form included sixquestions(a combination of Likert scale and open-ended responses):
- "Howsimplewasittonavigatetheapp?"
- "Werethevisualcomponentsuser-friendly(contrast, text size)?"
- "Didyouexperienceanymomentsoffrustration?"
- "Evaluatethebudgettrackingfeature(onascale from 1 to 10)."
- "Didtheappfulfillyourexpectations?"
- "Nameoneimprovementyouwouldrecommend."

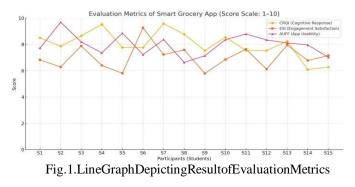

Results:

- AverageAUFFscore:8.22outof10.
- Mostusers found thatvoice andtouchcontrols worked smoothly.
- Usersvaluedthelackofadsandtransparencyin theapp's design.
- Suggestionsforimprovementsincludedoptionsfortheme customization and predictive textinput.

IV. RESULTS AND DISCUSSION

A. Conceptual Insights

The core concept of the grocery application aimed to pro- vide a user-centric framework that reduces the cognitive load during grocery planning and shopping, incorporates natural voice-based interaction, and ensures real-time budget moni- toring. Ethical design practices were a priority, focusing on preventing dark patterns and maintainingtransparency.

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.538 Volume 13 Issue V May 2025- Available at www.ijraset.com

Key Findings:

- Mental Strain Reduction: Participants reported a sig- nificant decrease in mental effort when using the app for groceryplanning.
- Natural Voice Interaction: Voice-based conversations were found to be intuitive and effective, with users appreciating the ease of voice commands.
- Budget Monitoring: Real-time budget monitoring was well-received, with users responding positively to instant alerts when they approached their set budget.
- Ethical Design: The design avoided dark patterns, fos- tering trust and accessibility, especially for users with disabilities.

B. Technical Evaluation

From a technical perspective, the app's implementation using Android (Kotlin/Java) for the frontend, and Supabasefor the backend, provided a robust foundation for real-timedata processing and secure cloud storage. The integration of voice recognition and AI-driven meal planning features added significant value to the user experience.

TechnicalInsights:

- AI-Driven Planner: The AI-driven meal planner was praised for its personalized recipe suggestions, which aligned well with user preferences and dietary needs.
- Real-timeBudgetMonitoring:Instantbudgetalerts were found to be an effective way to keep users engagedUsabilitytests conducted with 15universitystudentspro-duced andinformedduringtheshoppingprocess. Verwhelminglypositivefeed backacrossthree majorevaluation
- Usability: While theapp's usabilitywas generallyhigh, ametrics: CRQI, ESI, and theaverage scores fromall evaluations smallnumberofusersnotedtheabsenceofadark modewereabove7.5ona10-pointscale,withparticularly favorable as a potential improvement.comments on how easy it was to use, cognitive clarity, and the userinterface'sreliability. These results uggest that the framework can significantly lessen the mental and organizational stress commonly linked to grocery planningtasks.

C. UserFeedbackandSuggestions

Overall, users were highly satisfied with the app's function- ality, particularly the voice commands, budgeting feature, and recipe recommendations. However, there were some areas for improvement:

- Customization Options: Users suggested adding more options for theme customization and predictive text input to enhance the app's flexibility and usability.
- Dark Mode: The absence of a dark mode was frequently mentioned as a desirablefeature.

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.538 Volume 13 Issue V May 2025- Available at www.ijraset.com

V. CONCLUSION

This study focused on creating, developing, and assessing versatile smart grocery app framework that emphasizes AI functionalities, ethical considerations, and accessibility. In contrast to conventional grocery applications that tend to prioritize aggressive profit strategies and standard features, this framework incorporates voice-enabled organization, AI-driven recipe recommendations, and real-time budget monitoring, all while following user-centered designprinciples.

Utilizing Android for the user interface and Supabase as a reliable open-source backend, the prototype illustrated that it is possible to build effective yet lightweight systems without sacrificing performance. The modular nature of the framework allows for flexibility, making it suitable for various settings whether for private users, groups of students, or larger com- munity food access initiatives.

Perhaps the most important aspect of this project is its commitment to anethically drivendesignapproach. In an era where deceptive practices and manipulative user interface strategies are frequent, this app framework presents a clear, respectful, and inclusive option. This ethical framework, paired with intelligent automation and user-friendliness, could set new standards in the grocery and retail technology fields.

In summary, the suggested framework serves not only as a prototype but also as a fundamental resource for developers and researchers who wish to create impactful, user-centric gro- cery applications. Future developments could include features such as multilingual voice capabilities, AI-oriented nutrition tracking, and machine learning technologies for customized grocery optimization.
