Abstract: Now every day in metropolitan cities air and pollution becomes serious problems, because of high decibels and deadly gases gift within the environment that directly impact on human's health and therefore wants a special attention. Therefore, it has currently become necessary to regulate the pollution (air and noise) to make sure healthy livelihood and higher future. In this paper, a good implementation for net of things is employed for observation atmospheric conditions of environment like air pollution and noise pollution. Presently multi day in metropolitan urban areas air and pollution finally ends up important problems, because of high decibels and deadly gases gift within the earth that specifically impact on human well-being and subsequently needs an uncommon consideration. During this manner, it's now turned out to be important to regulate the pollution (air and noise) to ensure solid employment and higher future. During this paper, a robust usage for internet of things is employed for perceptive air states of condition like pollution and noise pollution. This paper displays an applied style for an adaptable, adaptable and price effective for checking the air and sound nature of a selected website. This framework proposes an air quality associated additionally noise pollution perceptive framework that permits us to screen and check live air quality and sound pollution in a very region through iot. Framework utilizes air sensors to discover distance of hurtful gases mixes noticeable all around and frequently transmit this data. Likewise, framework continues estimating sound Dimension and reports it.

Keywords: Air Pollution, IOT, Weather, Pollution Real-time remote monitoring

I. INTRODUCTION

Air and sound pollution could be a growing issue of late. It's necessary to observe air quality and keep it in check for a much better future and healthy living for all. Here we have a tendency to propose associate air quality similarly as pollution observation system that permits us to observe and check live air quality similarly as sound pollution in a very explicit areas through iot. System uses air sensors to sense presence of harmful gases/compounds within the air and perpetually transmit this knowledge to microcontroller. Conjointly system keeps measurement sound level and reports it to the net server over iot. The sensors move with microcontroller that processes this knowledge and transmits it over net. This enables authorities to observe air pollution in numerous areas and take action against it. Conjointly authorities will keep a watch on the sound pollution close to faculties, hospitals and no honking areas, and if system detects air quality and noise problems it alerts authorities in order that they will take measures to regulate the problem. Within the past decade, human life modified as a result of the web. The web of things has been publicised as one of the most important development to be accomplished throughout the web portfolio of technologies. Internet of things (iot) cares with inters connecting human activity objects that area unit put in at completely different locations that area unit presumably distant from one another. Internet of things represents an inspiration within which, network devices have ability to collect and sense knowledge the planet, so share that knowledge across the internet where that data can be utilised and processed for numerous functions. The internet of things describes a vision where objects become part of internet: where every objects unambiguously known and access to the network. Iot communication is kind of completely different from the standard human to human communication, transferral an oversized challenge to existing telecommunication and infrastructure. Any additional, iot provides immediate data relating to access to physical objects with high potency. The conception of net of things is incredibly abundant useful to attain real time observation of sensing element knowledge. Net of things (iot) is a kind of network technology, which is supported data sensing equipments like RFID, INFRARED SENSORS, GPS, optical device scanners, sensors and shortly, will create something be part of the internet to exchange information, in line with the protocol, which supplies intelligent identification, location and chase, observation and management. Cloud computing provides the access of applications as utilities, over the net. During this paper system utilizes air sensors to sight closeness of destructive gases/mixes noticeable all around and regularly transmit this information. Additionally, framework continues estimating sound dimension and reports it.

The sensors interface with microcontroller that forms this data and transmits it over the appliance. This allows specialists to screen pollution in numerous territories and act against it. This model is elastic and distributive for any infrastructural atmosphere that wishes continuous looking at, dominant and behaviour analysis. Additionally thereto, the system offers a provision to store previous measured data. This allows the authorities to analysis the air quality of desired house. This method would contribute as a neighbourhood inside the building of a healthy society. The paper additionally discusses the fundamental conception of internet of things and its potential applications, particularly for weather observation

II. REVIEW OF LITRETURE

- 1) P. Sai Chandana, K. Sreelekha, A. Muni Likith Reddy, M. Anil Kumar Reddy, R. Senthamilselvan, "IOT Air And Sound Pollution Monitoring System", International Journal on Applications in Engineering and Technology, 2017.

This paper describe pollution could be a growing issue for currently. It's terribly necessary to watch air quality and keep it in restraint for a higher future and healthy living for all. Here we have a tendency to propose associate air quality yet as pollution observance system that permits us to monitor and check live air quality yet as pollution in a explicit space through iot. System uses air sensors to sense presence of harmful gases/compounds within the air and constantly transmit this knowledge to microcontroller. Additionally system keeps measurement sound level and reports it to the net server over iot. The sensors move with microcontroller which processes this knowledge and transmits it over net. This allows authorities to watch pollution in several areas and take action against it. Additionally authorities will keep a watch on the pollution close to faculties, hospitals and no honking areas, and if system detects air quality and noise problems it alerts authorities in order that they will take measures to regulate the issue

- 2) Dhruvil Shah, Prathmeshn Kudale, Prasad Shirwadkar, Samuel Jacob, "IOT Based Air and Sound Pollution Supervising System", IOSR Journal of Engineering, 2018.

This paper describe the automatic air & sound management system is a revolution to contribute an answer to the largest threat. The air & sound observance system overcomes the matter of the highly-polluted areas that could be a major issue. It supports the new technology and effectively supports the healthy life concept. This method has options for the individuals to watch the amount of pollution on their mobile phones using the application. So, it becomes terribly reliable and economical for the municipal officers alongside the civilians to watch environment. Holding civilians conjointly concerned during this method adds an additional price thereto. As civilians are currently equally aware and curious about their surroundings, this idea of iot is beneficial for the welfare of the society. And it is implemented using the newest technology.

- 3) Sindhu K.G, Shruthi H, Sumanth M.B, Vijayashree H.M, Ayesha A.P, "IOT Based Air and Noise Pollution Monitoring System," International Journal of Innovative Research in Science, Engineering and Technology, 2018

In this paper, this iot based mostly air and pollution observance device may be a nice step towards a healthy bread and butter. With the help of this device not solely the municipal authorities however even the people will participate within the method of controlling pollution and guarantee safe atmosphere. These automatic devices, once put in are capable of incessantly tracking the pollution level and analyze the detected information. The foremost lightness feature of this device is that the output is painted in digital in addition as analog format with the assistance of an easy mobile application that is usable on all robot devices like sensible phones, tablets, pda's etc. The device itself is extremely eco-friendly and doesn't harm the atmosphere in any means. Moreover, it's supported one of the trendy technology and conjointly cheap as compared to alternative technologies developed up to now and may be installed anyplace.

- 4) Souvik Manna, Suman SankarBhunia, "Vehicular Pollution Monitoring Using IOT", IEEE International Conference on Recent Advances and Innovations in Engineering (ICRAIE-2014), May 09-11, 2014.

In this paper degradation of air quality in cities is that the results of a fancy interaction between natural and evolution environmental conditions. With the rise in urbanization and industrial enterprise and thanks to poor management on emissions and tiny use of chemical change converters, an excellent quantity of particulate and toxicant gases area unit created. The target of this paper is to watch pollution on roads and track vehicles that cause pollution over a fixed limit. Increasing variety of cars may be a major problem that has been around for a awfully very long time. This paper proposes use of net of things (iot) to deal with this drawback. Here, combination of wireless detector network and chemistry toxicant gas sensors and therefore the use of frequency identification (RFID) tagging system to watch automotive pollution records anytime anyplace.

III. METHODOLOGY

This system is formed to fulfill the purpose and need of the society to watch and check the live air quality and sound pollution in a section through IOT. The system uses air sensors to see the presence of harmful and unsafe gases/ compounds [such as methane, propane, Butane, alcohol, deadly gases, monoxide etc.] within the air and also uses the sound detector to stay measuresound level in the surroundings. air sensors that are used to collect air pollutants and a sound detector module mic is employed to capture sound. These sensors act with microcontroller that processes this information then transmit it over the mobile application. To send the info over remote location WiFi modem is additionally put in. With this system not solely the authorities however additionally the localized people will check the transmitted information through their mobile phone which too while not payment single penny and also the people will act against it on their level and take a look at to bring the pollution level under control. thismethod would contribute as a part within the building of a healthy society.

Fig 1: Block diagram of proposed system

- 1) *Node MCU Controller:* Node MCU is an open source IOT platform. It includes firmware which runs on the ESP8266Wi-Fi SoC from Espressif Systems, and hardware which is based on the ESP-12 module. The term “Node MCU” by default refers to the firmware rather than the development kits.
- 2) *Air Sensor:* Air sensor detects Pollution.
- 3) *Wi-Fi Module:* A WIFI module is used to communicate with IOT platform.
- 4) *LCD Display:* The air pollution is detected, a buzzer immediately beeps and when there is a noise pollution an LED starts blinking continuously and displays message.

IV. FLOW CHART

Fig 2: Flow chart of proposed system

V. ADVANTAGES

- A. All general pollution data can be accessed anywhere with the help of IOT.
- B. Real time monitoring at different section will be done.
- C. Alerts of extreme quality conditions are generated at the server end.
- D. It will help us to control environmental pollution by taking different actions according to alerts.

VI. CONCLUSION

In this paper, a productive usage for internet of things is used for perceptive air states of condition like air pollution and noise pollution. This paper displays a calculated engineering for an adaptable, adjustable and price effective for checking the air and sound nature of a particular website. Framework propose associate in nursing air quality and in addition sound pollution perceptive framework that allows us to screen and check live air quality and additionally sound pollution in a very region through iot. This paper presents a conceptual architecture for a versatile, versatile and price economical for watching the air and sound quality of a specific website. We have a tendency to propose an air quality as well as noise pollution observation system that enables us to monitor and check live air quality in addition as sound pollution in a region through iot.
