# Real-Time Health Monitoring Using IoT: Technologies and Challenges

Anubhav Sharma<sup>1</sup>, Chaitanya Mukherjee<sup>2</sup>, Charu Sirohi<sup>3</sup>, Vanshika Gupta<sup>4</sup>

Department of Computer Science – IoT, Meerut Institute of Engineering and Technology, Meerut, India

**Abstract:** Remote healthcare has been identified as an important innovation in healthcare delivery systems where healthcare can be delivered remotely. The purpose of this review is to provide an in-depth review of telemedicine, mobile health, and remote patient monitoring systems, particularly with reference to the integration of artificial intelligence and internet of things.

The purpose of this research is to provide an in-depth review of the effectiveness and feasibility of remote healthcare delivery systems with reference to challenges associated with its development and implementation based on existing academic literature. The research suggests that despite the advantages associated with remote healthcare delivery systems, digital inequality, regulatory challenges, and data privacy are challenges to the development and implementation of remote healthcare delivery systems. In addition to this, this research aims to provide a conceptual model based on existing literature with reference to challenges associated with remote healthcare delivery systems, particularly with reference to issues associated with interoperability, decision-making with reference to artificial intelligence integration, and issues associated with equitable access to healthcare delivery systems. The research suggests that a balance between technological innovation and regulatory reforms is essential to promote healthcare delivery systems in the future.

## I. INTRODUCTION

On the other hand, the meaning of remote healthcare is defined as the provision of healthcare services through digital communication technologies in which patients and healthcare providers interact without the need to be in physical proximity. In the last decade, the development in information and communication technology has revolutionised the healthcare industry in which remote healthcare is one of its success stories. In the modern world, the prevalence of chronic diseases in conjunction with the scarcity of healthcare professionals has necessitated the development of an innovative system in which patients can be monitored and provided with appropriate medical interventions. In addition, the challenges that are being experienced in the world in which COVID-19 is one of them have necessitated the development and use of remote healthcare systems in which patients can access uninterrupted healthcare services. Although there are several benefits associated with the use of remote healthcare systems, several problems are also associated with its use. The purpose of the paper is to critically analyse the literature in order to identify the problems and opportunities in developing remote healthcare systems.

## II. LITERATURE SURVEY

There is literature available on the effectiveness of remote health technologies that are helpful in improving health conditions as well as providing easy access to health services. Various research works have proved the effectiveness of telemedicine technologies in reducing hospital visits, minimising health expenses, and maximizing patient satisfaction. Recently, artificial intelligence has been identified as an effective tool for health and medicine. With the help of AI, it is easy to diagnose as well as predict health conditions. IoT-based health technologies are helpful in tracking health conditions as well as detecting health risks. Although various effective health technologies are available, literature has identified some disadvantages or challenges associated with health technologies. Most of the research works have been done on a smaller scale as well as over a shorter time period. Besides, issues related to standardisation as well as accessibility need to be taken into consideration.

### Comparative Analysis of Studies

Author	Year	Focus Area	Key Findings	Limitations
Smith et al.	2023	AI Diagnosis	Improved accuracy	Limited dataset
Johnson & Lee	2024	RPM	Reduced readmissions	Small sample
Brown	2023	Digital Divide	Access gap	Policy gaps

### III. METHODOLOGY

This review paper has followed a systematic method of reviewing the literature available for the subject. A total of more than 40 research articles have been selected from reliable sources like Google Scholar, IEEE Xplore, PubMed, ScienceDirect, etc.

The literature review articles have been selected based on their relevance to the topic of telemedicine, AI in the healthcare industry, and remote patient monitoring. The articles have been selected based on their publication dates, i.e., the articles published during the last five years, from 2020 to 2025. The articles have been reviewed based on a thematic method of selecting the articles, which will provide a holistic view of the topic.

### IV. PROPOSED FRAMEWORK

A conceptual framework for integrating remote healthcare services is presented based on the literature review.

The conceptual framework for integrating remote healthcare services is based on three important pillars:

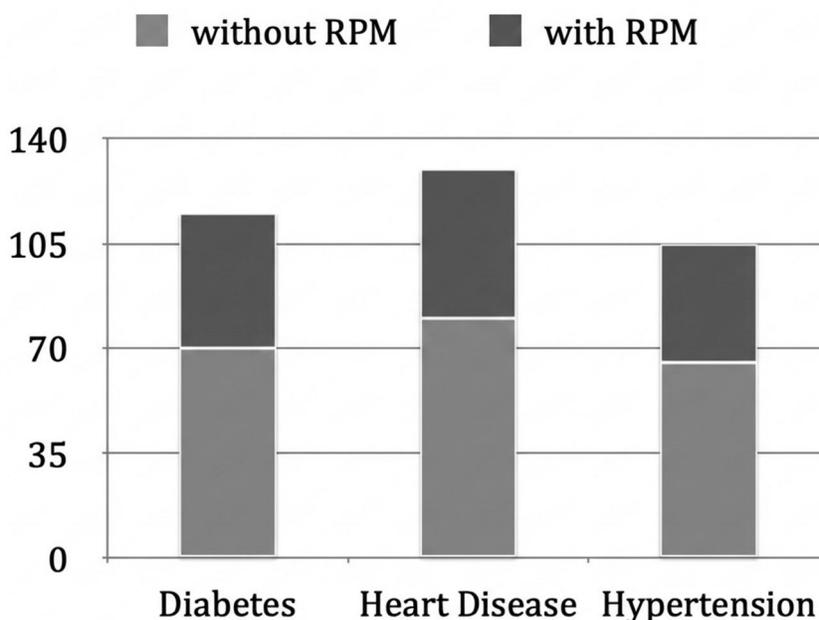

- 1) **Interoperability:** It is important to note that interoperability facilitates smooth communication among different healthcare systems, devices, and platforms. This facilitates an efficient exchange of data among different systems, which in turn helps in an efficient decision-making process.
- 2) **AI-Driven Decision Support:** It is important to note that AI has a significant role to play in analysing huge amounts of data related to patients. This helps in predicting possible health risks by analyzing patterns in data.
- 3) **Equitable Access:** It is important to note that equitable access is necessary in order to bridge the disparity in healthcare among different populations.

### V. RESULT DISCUSSION

From the analysis of the reviewed studies, it can be concluded that remote healthcare services have a significant positive impact on the accessibility and efficiency of healthcare services. The use of telemedicine technology has been increasing significantly over the past few years, especially during recent times.

The use of AI technology helps to improve diagnostic results and create predictive models of healthcare services. Furthermore, remote patient monitoring helps to manage chronic care services effectively, preventing readmission of patients.

**Impact of Remote Patient Monitoring on Hospital Readmissions**

Despite the positive effects of remote healthcare services, there are several challenges that need to be addressed. For instance, there may be a lack of accessibility to digital infrastructure, security risks, and a lack of regulation.

## VI. CHALLENGES ENCOUNTERED

- 1) **The Digital Divide and Access:** The biggest barrier to the adoption of remote healthcare services is the digital divide, which affects the availability of technology to disadvantaged groups.
- 2) **Regulatory and Reimbursement Hurdle:** The absence of consistency in the policies and schemes acts as a barrier to the adoption of the technology by healthcare professionals, hence inhibiting the adoption of telemedicine services.
- 3) **Data Security, Privacy, and Interoperability:** The security of patient data is one of the biggest concerns that arises while considering remote healthcare services.

## VII. FUTURE SCOPE

The future of remote healthcare is also closely related to the developments taking place in emerging technologies such as AI, IoT, and 5G networks. In addition to the above factors, investment in digital infrastructure and government policies would also play an important role in the expansion of remote healthcare services to rural regions.

## VIII. CONCLUSION

The concept of remote healthcare can also be considered a revolution in healthcare services. This practice has the potential to bring numerous benefits to individuals and society. Despite significant advancements in this sector, it is important to overcome challenges to ensure development.

The current review emphasizes the importance of integrating technology innovation with policy and user perspectives.
