The Origin of Flora and Fauna on the Earth and their Existence

Vinoy Gopal
Bodhgaya, Bihar, India

I. ORIGIN

Different kinds of organisms on the earth, including humans, have originated from the transformation of energy released from the disintegration of different kinds of organic matter when all conditions are favorable. Here, favourable conditions mean the right environment. Balanced presence of necessary environmental factors like air, water, sunlight, invisible rays coming from celestial bodies, soil, temperature, minerals, energy etc. These external conditions create a beneficial environment to make the origin successful. For the origin of different types of plants and animals, it is necessary to have different types of suitable conditions. In the absence of anyone of the favourable conditions essential for origin, origin will not take place and if there is a deficiency in the suitability of anyone favourable condition, the origin will be defective. When flowers, fruits, leaves, twigs, roots etc. in fields, gardens and forests disintegrate under specific conditions, the energy released from them is transformed into different kinds of colorful insects, butterflies, moths, wasps, beetles, caterpillars and leaf insects, i.e. into life. The energy released from the disintegration of peels of fruits, vegetables etc., leftover food and weeds in drains and different kinds of moist grains in closed boxes and stores is transformed into different kinds of insects, i.e. into life. Insects born from the energy released from the disintegration of green gram (mung) fly in the air. When cow dung rots in the rainy season, the energy released from it is transformed into beetles. When food items are digested in the stomach of living beings, the energy released from them is transformed into red blood cells, white blood cells, platelets and sperm/egg, i.e., into life, through a process. When the conditions in the stomach are not fully favourable and the food and water are contaminated, the energy released from the digested food is transformed into parasitic worms like tapeworm, hookworm and roundworm and bacteria like Helicobacter pylori. Fertilization and development of the embryo takes place from the energy released from the disintegration of male sperm and female egg in the fallopian tube. In the presence of water, air, heat, etc. in the soil, the energy released from the disintegration of grains sown in it is transformed into sprouts, i.e., into life.

Before the origin of flora and fauna on the earth, metals, semi-metals, minerals, gases etc. were formed during the formation of the solar system. During the same period, the process of cloud formation and rainfall started. Seasons like winter, summer and rain were formed, wind started blowing and moisture came in the air. In such a situation, due to the rotation and revolution of the earth, the difference in temperature on land and water surface, wind blow, tides and evaporation, cold and hot water currents started in the sea. This produced foam containing dust particles and minerals in the sea water. Calm areas were formed in the middle of water currents in the oceans. Due to evaporation in calm areas, water became salty. Foams containing mud accumulated on these calm areas and shores. The foam disintegrated in the presence of water, air, moisture and sunlight, releasing the energy contained in it. This energy got transformed into life in the form of red, green, blue and brown colored aquatic plants (algae) in water, coastal areas, tidal pools and coastal reefs. This happened in the presence of carbon, hydrogen, oxygen, nitrogen, phosphorus, potassium, calcium, magnesium, sulphur, zinc, iron, copper, boron, manganese, molybdenum, chlorine etc., present in sunlight, soil and air. Flowering eel plants, saprophyte trees growing in abundance on beaches, plankton plants floating in water and others – a total of 72 types of red, green, brown and black coloured plants also originated from the transformation of energy. Sargassum grass originated in the Sargasso Sea spread over about 11000 square kilometres in the North Atlantic Ocean in a similar manner through the transformation of energy. Like the sea, in all the water bodies present on the earth and on their shores, different types of small and big plants originated in different environmental conditions. Later, by the transformation of energy released from the decomposition of these plants, living beings, including humans, originated. After origin, further growth of plants has been through the upward process of germinated plants and the growth of animals has been through asexual and sexual reproduction.

Most of the animals and plants that originated from the transformation of energy in a particular period of the past are not being originated in the same way from the disintegration of organic matter in the present because the environmental balance of that particular period of the past does not exist today and it is quite possible that the particular plants that decomposed and released energy for the origin of organisms in that period may have become extinct.

All the organisms of the world have been divided into 10 classes on the basis of similarity and dissimilarity in their form and quality. The chromosomes of all organisms of all classes are different. Therefore, their children differ in form and quality. The favourableness of the conditions plays a very big role in the origin of solid and visible organisms from the transformation of subtle and invisible energy. Due to occasional specialties or flaws in the suitability, specialties or flaws can be seen in the children born through asexual and sexual reproduction. In case of such a trait, a female monkey of Homo sapiens can give birth to a gorilla like child, a gorilla can give birth to an orangutan like child and an orangutan can give birth to a human like child.

When there is compatibility defect or in special circumstances, the egg and sperm of parents with different chromosomes combine to give birth to deformed children. According to recent viral news, a female dog gave birth to a male child with human like head and dog like body, a female goat gave birth to a male child with human like head and goat like body, a female (human) gave birth to a male child with gorilla/dog like head and human like body and a buffalo gave birth to a calf. This is a case of deformity and not atavism.

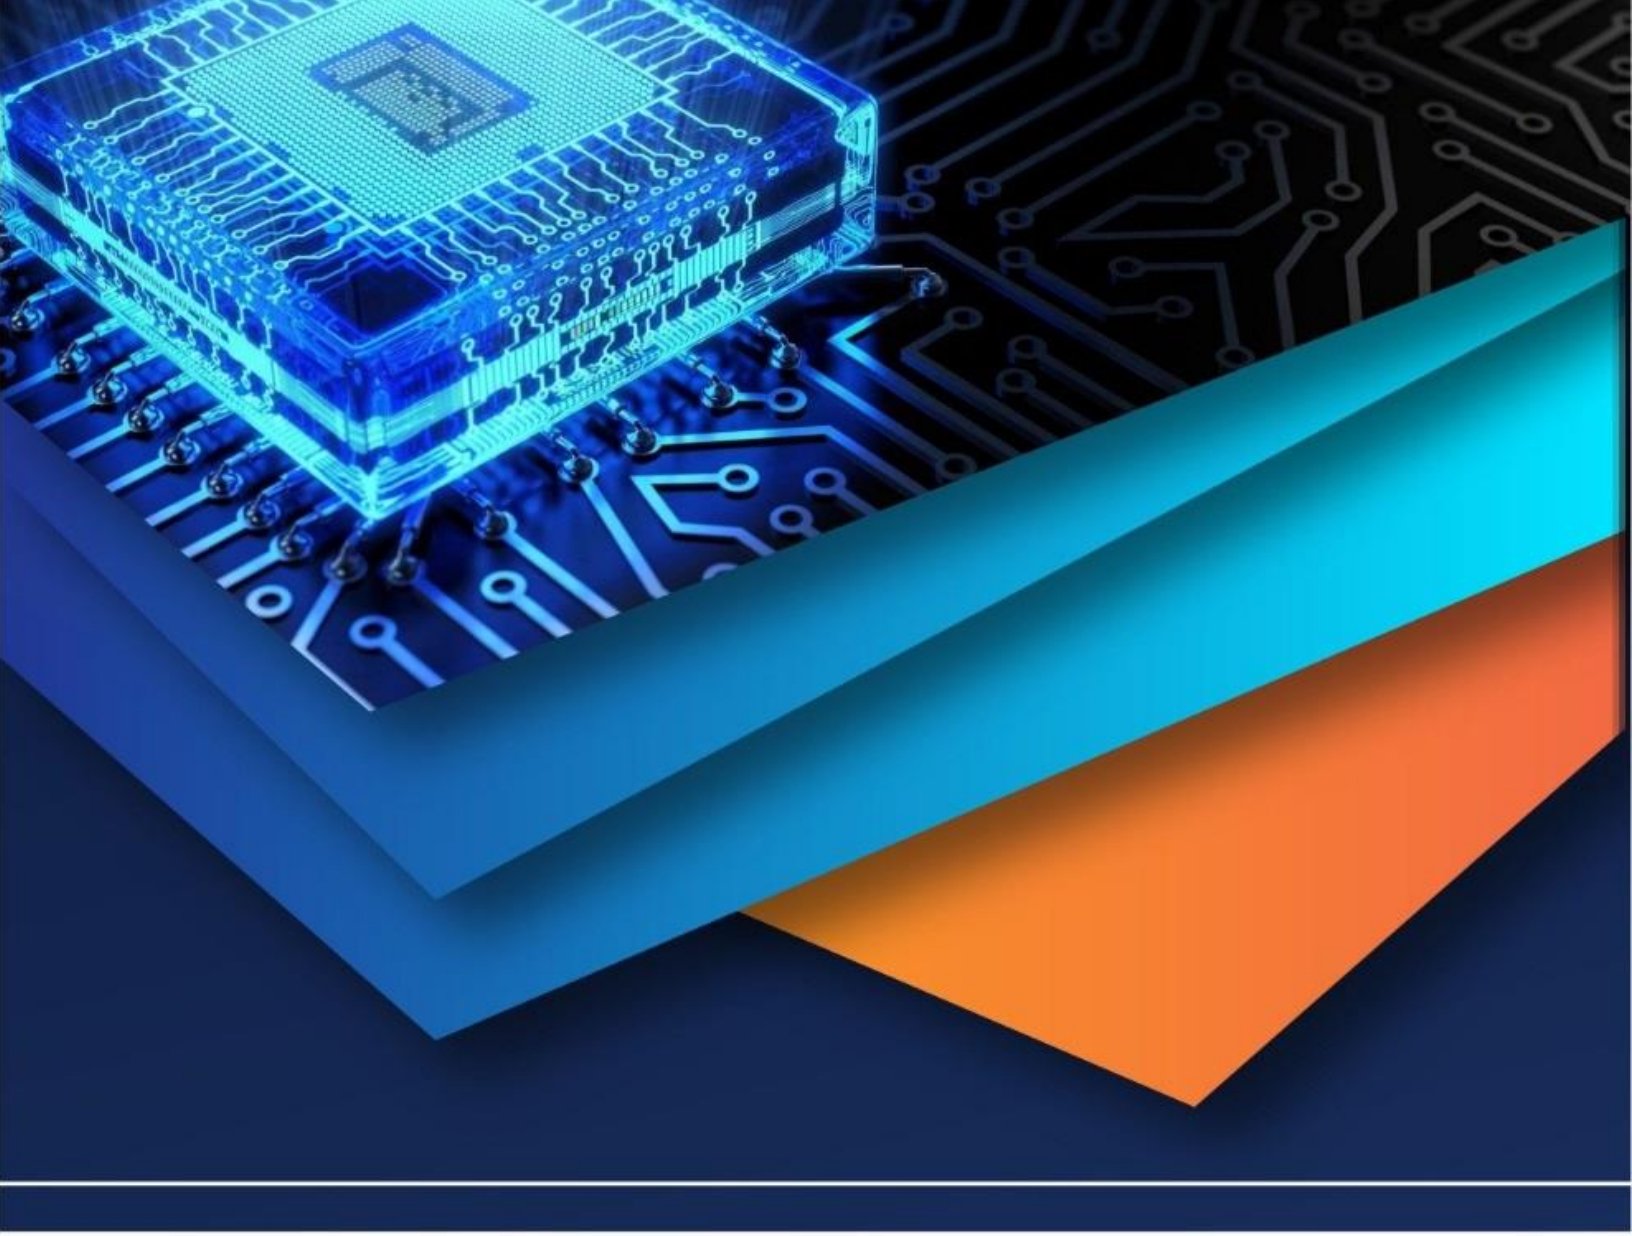

II. EXISTENCE

The earth revolves around the sun at a speed of 1783 kilometres per minute and rotates around its axis at a speed of 27.8 kilometres per minute. Here the revolution speed of the earth is 64 times more than its rotation speed. Due to these movements, low atmospheric pressure is formed around the earth. Due to low atmospheric pressure around the earth, the earth being round in its shape, the earth being inclined at an angle of 23.5 degrees towards the north due to the effect of the vast ocean water, and the 3.56×10^22 Newton gravitational force (centripetal force) between the earth and the sun, the earth moves forward on its axis i.e. from west to east. Here the earth does not rotate continuously on its axis like a top, but rotates intermittently like the second hand of a quartz clock with jerks at a short and certain interval. Since 29% of the earth is terrestrial (solid) and 71% of the earth is aquatic (water.) Here the weight of terrestrial part and the aquatic part is not the same. The weight of terrestrial part is more than the aquatic part. Also, the inertial forces of terrestrial part and aquatic part moving in rotation together are not the same. The inertial force of terrestrial part is more than the aquatic part because the size and volume of solid are fixed, the particles of solid are adjacent to each other, more force is required to divide solid as compared to liquid and there are strong intermolecular forces between the particles of solid. Due to this, more force (inertial force) is applied in the opposite direction on the terrestrial part of the rotating earth as compared to the aquatic part. Due to the difference in the inertia force of the terrestrial part and the aquatic part, there is a difference in their speed as well. The aquatic part moves faster than the terrestrial part. Here, the heavier terrestrial part pulls the fast moving lighter aquatic part behind it, preventing it from moving ahead alone which causes a jerk in the earth. This phenomenon occurs repeatedly after a certain interval due to which the earth rotates on its axis while beating. This phenomenon also proves helpful in rotating the earth on its axis just like when one of the two bulls yoked to a Bullock cart moves faster than the other, the cart does not move in a straight line but on a circular path. Here, the jerk generated in the earth has a direct effect on the flora and fauna situated on its surface, which causes pulsation in them. Due to this pulsation, their physiological system gets activated and they remain alive and their existence on earth remains intact. The day the earth stops rotating with jerks, the life of creatures on earth will come to an end on that day.The effect of jerk of the rotating earth on the plants can be seen while measuring their growth with Cresco graph. Here, the growth does not appear continuous but appears to be intermittent with jerks.

Due to illness, worry, tension, fear, nervousness, distraction of mind, hard physical labour, electric shock, earthquake, storm etc., cause imbalance in the effect of earth's jerk on living beings due to which they become restless and unhealthy. In the state of meditation, sleep and rest, the beats produced in living beings is in a more balanced state with the earth's jerk. Sleep comes to achieve this balance. By completely concentrating on the heartbeat of the body, one can achieve happiness, peace, good health along with longevity, telepathy and omniscience. Man can conquer death synchronizing his heart beat with the earth's beat. In this state breathing slows down completely, almost stops.

In the absence of the direct effect of the earth's jerk, the animals and plants on earth cannot survive for long in space or on any other planet. There their muscles, bones and their heart gradually start weakening. There their physiological system is active in the beginning but due to lack of direct support of the Earth's jerk, it gradually starts slowing down, due to which their life span starts diminishing. Due to the counter clockwise rotation and the jerk of the revolving earth, almost all the people present on the earth are right-handed. They use their right hands/ legs first in performing all kinds of work. While playing football etc., they move their right foot first. In discuss throw, Javelin throw, hammer throw and batting or throwing balls in cricket, they frequently use their right hands. Activities like running, long jump, high jump, they move their right leg forward first. In infancy, children first extend their right hand to grab toys, fruits etc. A drunkard walking unsteadily on a road turns and falls again and again in the direction of the rotating earth with jerks.
