Wireless Phone Cover Charger Using Solar Energy

Yash Tiwari¹, Mohd Amaan², Vikas Kumar³, Rini Gupta⁴, Shivam Porwal⁵

Undergraduate Students, Department of Electronics and Communication Engineering, Axis Institute of Technology & Management, Kanpur, India

Abstract: In this paper, completely different geometrics of a solar battery associated coil are realized by analyzing its practicality to get an optimum wireless phone cover charger. Wireless charging could be a terribly broader space of analysis and an amazing quantity of analysis is already been exhausted. However during this paper, we've got tried enquiring the choice approach for charging wirelessly that's charging through solar battery and coil by fixing it during a approach in order that it result for constant.

Keywords: Solar plate; Rechargeable Lithium Polymer Phone Battery; Switch; Wireless charger; Charging Module

I. INTRODUCTION

Wireless phone cover charger is moreover known as Wireless force move, is an innovation that empowers the supply to transmit the electromagnetic strength to an electrical burden via the air hollow without interconnecting ropes. This development is attracting a vast collection of usages from a low pressure tooth brush to excessive energy automobile thinking of its solace and higher purchaser encounter. Presently a-days, this improvement is swiftly developing from hypotheses towards the standard segment of a business thing, if there should be an occasion of sharp contraptions. Basically, the wireless phone cover charger makes use of solar strength to price itself, after which deliver energy to the specific phone cover charge. Wireless phone cover charger makes use of induction coil, which generate flux and price the battery of the specific charger.

A. Fundamental Principle Of Charging In Wireless Phone Cover Charger

Wireless force circulate is procedure that's nearly like the crucial correspondence machine procedure. Force is have to be moved from transmitter to the receiver via way of means of utilizing diverse improvements or schemes (i.e., coupling method, RF strategy) that's as like that of the message sign change from the transmitter to the receiver within the crucial correspondence machine wherein it's been applied diverse types of tweak plans that are applied to transport the message sign viably. In a truthful way to nation the Wireless charging improvements are just like of stability plots within the correspondence systems. Source power is the battery of the wireless phone cover charger which transmit its energy to the receiver system.

B. Block Diagram

The below block diagram shows how the system of wireless phone cover charger works: In this, solar plates act as a source of energy which generates the power of 6V. While the batteries give output the system of 3.8V. There is an automatic cutoff is stable in the system in case of full charged system. We have used switch as an operator which controls the flow of electricity. The below part of the block diagram shows the concept of wireless charging.

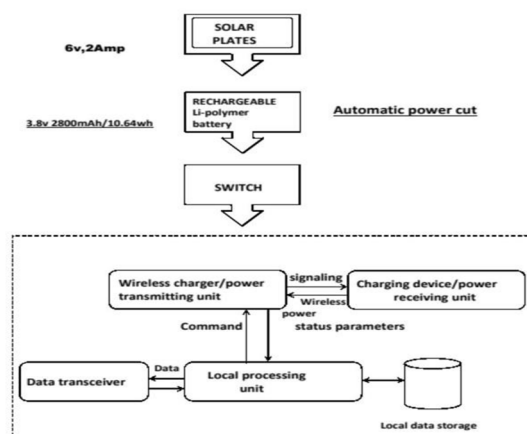

Figure 1(block-diagram)

II. ENERGY CONVERSION EFFICIENCY

Wireless phone cover charger calls for electric strength to be modified from AC to electromagnetic waves and in a while to Direct current. Every transformation consists of the misfortune within the well-known strength, which generally activates regular Wireless charging effectiveness drifting around half to 70%. This surprise is main in Radiative and acoustic pressure flow advances wherein for radiative charging the effectiveness is round 70-75% and wherein it involves acoustic pressure flow the skill-ability is round 55-65%, this in mild of the reality that the electric strength want to head for extra level i.e., convert to mechanical vibration strength so the charging productiveness dropped by 10%.

A. Literature Review

In this we discussed about different papers from where we get an idea. Basically, solar cell phone is a device which converts solar energy to electrical energy through solar panel and store that energy into a cell or battery [1]. We know that Faraday's law states that change in magnetic field produces electric field [2]. While we also know that wireless charging power is transmitted through air gaps mainly in mobile devices as well as many other gadgets [3]. In 2007 a research group from MIT made a remarkable achievement by lighting a 60W bulb while maintaining a distance of meters between the transmitter and receiver pads. Also made a surety to increase the distance. After several efforts, researchers have improved the WPT with an efficiency of 96% [4].

B. Proposed Technique

In this we discuss about the working of the module and its part. Solar panel works as the source of energy for the battery. It produces the energy of 6V each which charges the phone cover battery. Phone cover battery produces energy of 3.8V. This energy has been transferred to wireless charger. It converts DC voltage to electromagnetic force. This emf is used to charge the battery of the phone through induction coil.

III. COMPONENTS

A. Solar Plate

Attaching two solar plates in parallel to increase power. Single solar plate generates the power of 6V. It does not produce any radiation. It is not corroding as well as not having any dust.

Figure 2(solar plate)

B. Battery (Each of 2800mAh)

To increase the power of battery we connect two batteries in parallel. It helps in working the system properly. Not excreting fluid or gases. Not having any bulk. Output of battery is 6V.

Figure 3(Battery)

C. Indicator

It is directly connected to the battery. It shows the charging percentage of the wireless phone cover charger

D. Switch

It is used to connect the battery and wireless charger. It is used to discard the flow of power throughout the circuit.

Figure 4(switch)

E. Wireless Charger

It generates the electromagnetic flux throughout the circuit.

Figure 5(wireless charger)

IV. CHARGING MODULE

The given module has two batteries which take power from the solar panel. While there are two modes of charging, one is through a solar panel and another is through electricity. This module gives a 1-ampere charging current. Almost all of the digital gadgets run with batteries. And those batteries can get discharged. Therefore, chargers are used to feed them through placing electricity into them.

A. Charging Time

0 to 25 % = 37 min.

25 to 50 % = 1:15 hours

50 to 75 % = 1:52 hours

75 to 100 % = 2:30 hours

By analyzing the above timings, we have created a graph or a clear understanding of charging time.

Figure 6(charging time)

B. Discharging Time

100 to 74 % = 37 min.

74 to 43 % = 1:15 hours

43 to 22 % = 1:52 hours

22 to -5 % = 2:30 hours

By analyzing the above timings, we have created a graph for a clear understanding of charging time.

Figure 7(discharging time)

V. RESULT & DISCUSSION

The research was conducted through stages as follows: This device has been designed in many building blocks: Attach mini solar plate, rechargeable lithium polymer phone battery to the wireless phone cover charger. Checking its physical behavior. Voltage drop across the device. Charge the battery through solar panel. Temperature introduced in the battery while charging. Setup all the components together in the given module. Introducing the current meter across the loop. Examine the circuit by providing electricity. Voltage drop across the battery after charging. Charging and Discharging time of the battery. Setup the switch which connects the battery to the wireless charger. Setup Integrated circuits in the charger. Introducing induction coil to generate flux between the receivers and transmitter system.

VI. CONCLUSION

It was discovered from this research paper that the performance of the wireless phone cover charger using solar panel as the source of energy, which can charge the phone with 5000mAh battery in 2.5 hours. We can also state an overview that wireless charging advanced the world of charging. The solar panel is used like an asset which can be beneficial for us and save energy up to an extent level. It is also viable for different types of batteries with different ports. This promising innovation has fundamentally advanced during the previous decades and built up various easy to understand applications. While, the implementation of solar panel has given us a new way of charging our phone's battery wireless.
