Abstract: *The suitability of water quality for drinking purpose in the kanigiriMandal area was assessed by measuring physicochemical parameters, including major cation and anion compositions, pH, total dissolved solid, electrical conductivity, and total hardness. The nitrate concentration ranged between 6 to 45 mg/liter. The chloride concentration range of 125-195mg/liter, where the fluoride concentration ranges from 1.60 to 8.60 mg/liter. The Values obtained for different parameters, are compared with the standard values given by WHO/TSE and suitable suggestion were made in the kanigirimandal area. The water investigation was carried out to identify groundwater quality and its suitability for drinking purpose.*

Keywords: *Geochemistry, physico-chemical analysis, anions, cations, drinking water quality,*

I. INTRODUCTION.

Groundwater is a vital natural resource. Depending on its usage and consumption it can be a renewable or a non renewable resource. It is estimated that approximately one third of the world's population use groundwater for drinking . Groundwater is the major source of water supply for domestic purposes in urban as well as rural parts of India. The WHO has clearly stated that the quality of drinking water is a powerful environmental determinant of health. Drinking-water quality management has been a key pillar in the prevention and control of waterborne diseases. Water is essential for life, but it can and does transmit disease in all countries of the world from the poorest to the wealthiest. Safe drinking water therefore is a basic need and hence, an internationally accepted human right, and reducing the number of people without access to sustainable safe drinking water supply has been enlisted as one of the ten targets of the millennium development goals. The importance of water quality in human health has also recently attracted a great deal of interest . The evaluation and management of groundwater resources require an understanding of hydro chemical investigation and the same was carried out to identify groundwater geochemistry and its suitability for drinking purpose. The Prakasam district with its headquarters at kanigiri is bounded in the North by Guntur district, in the south by Nellore and Cuddapah districts, in the west by Kurnool district and in the East by Bay of Bengal and lying between north latitudes 14°57'00": 16°17'00" and East longitudes 78°43'; 80°25'00" in parts of Survey of India toposheet Nos. 56, 57I, 57M, 57N and 65A and 66N respectively. The geochemistry of the kanigiri vicinity, structural and denudational plateaus on proterozoic rocks with pediment and pediplains occur in the North, South and Central parts of the district. Structured hills, denudational hills and valleys on sedimentary rocks and colluvial terraces are seen in the North West, Central and South Western parts of the district. The Dharwarschist, Charnockites and peninsular gneisses occur as linear ridges, residual and structural hills and as shallow to moderately weathered pediplaindepos its. In this present work samples are collected in post and pre monsoon seasons and various parameter are study was carried out to report the data.

Monthly Mean Rainfall Distribution

II. EXPERIMENTAL SECTION

Polyethylene bottles cleaned with HNO₃ were used for sample collection. All bottles were rinsed with deionized water. The samples were collected after 10 min of pumping and stored in polyethylene bottles. The following parameter are studied using different methods.

S.NO	PARAMETER	METHODS USED
1	pH	electrometric method
2	Electrical Conductivity	conductometry
3	Total Dissolved Solids	Titration
4	Total Hardness as cacO ₃	Titration
5	Calcium Hardness as cacO ₃ -mg/l	EDTA Method
6	Magnesium Hardness as cacO ₃ -mg/l	EDTA Method
7	Nitrate	
8	Na ⁺	Flame Photometry
9	K ⁺	Flame Photometry
10	Fluoride	Ion selective eletrode
11	sulphate	ultraviolet absorption
12	Chloridre	Argentometric titration

III. RESULTS AND DISCUSSIONS.

Pre monsoon Sample analysis data expressed in ppm

S.NO	VILLAGE NAME	PH	EC	TDS	TH	F	Ca	Mg	Na	K	Cl ⁻	NO ₃ ⁻	SO ₄ ²⁻

IV. CONCLUSION

From the Ground Water Survey the following conclusions are drawn. The pH values of some villages of Kanigiri Mandal. The sample analysis shows acidic range to basic range waters hence use of these waters must be taken with care i.e., they cannot use this water for drinking purpose. High concentrations of chlorides above the permissible limits of 250 mg/L in water very salty and domestic use of these waters is unpleasant. The extreme high Total Alkalinity in the panchayats is almost very high and more than the permissible limits. These lead to scale formation in the cooking vessels and white precipitate formation in the buckets. The total hardness above the permissible limits given by WHO i.e., 500mg/L. Phosphates concentration was more than the permissible limits given by BIS. The presence of Fluorides permissible limits given by WHO more than in all these 8 panchayats. The nitrates are also within permissible limits. Water is the mirror of life and water is essential for drinking purpose. Water and life are inseparable. So protected water supply is very essential for population. In panchayats, municipal water supply i.e., potable water must be supplied to the total population to protect their health. There is municipal water supply in Kanigiri Mandal, it is not sufficient to the inhabitants. Hence use of bore well waters for washing, cooking, bathing etc is inevitable. From the survey it is clear that even the municipal water is having high chloride, alkalinity, total hardness, total dissolved salts and phosphates.

A. Remedial Measures.

- 1) Purification of water used for drinking
- 2) Supply of potable water to panchayats
- 3) To educate the people to boil water, filter and then use them so that the chlorides, alkalinity and hardness may be removed to some extent.
- 4) To educate to use toilets in every home.
- 5) Slogan – Potable water protects the health of consumers.

- 6) To conduct environment awareness camps at schools.
- 7) To educate to keep clean environment
- 8) To encourage to use natural fertilizers.
