Abstract: Information and communication technologies (ICTs) promise to upsurge government transparency, accountability and civic engagement by providing information about government activities. It reduces the bridge between people and government. Main focuses on sanitation and development of a municipal corporation. To make it possible, the people who belong to the municipal corporation are provided with an opportunity of raising complaints regarding any issue that take place in their locality such as un-cleaned and dirty things in our place. These issues are delivered to higher Authority of corporation (Admin) by people. The Twitter algorithm is used where the most tweets appear at the top of timeline. Cloud computing provides a framework and analytical tool that could enlighten Smart Municipality Concern.

Keywords: Information and communication technologies (ICTs), Twitter algorithm, Cloud computing, Smart Municipality

I. INTRODUCTION

In a developing country, there is no direct communication between people government. Lack of communication between people and government create a way for inducement. Still if unethical ways are followed there is no grantee that the desired work can be finished or not within given time. It is very costly thing to sacrifice a leave to lodge a complaint in person to the municipal corporation. The main purpose is to help the public who are facing different problems in the localities by online application. It can control unethical work of bribe and even it can reduce the processing time. Here the identification and solution for the complaints given by the people, rectifying them within the system generated time limit is the main concept of the project. A clear report is generated by the system which shows assignee name, complaint type/ department, etc. All the above attributes help while viewing the report of complaints. The admin examines weather the problem is rectified or not within the grace period. If it is not solved, then the report is automatically forwarded to the higher authorities so that it maintains an effective problem solving solution. It may include Garbage management, Water supply, Electricity management, Anima threatening and Road repairs.

III. PROCESSING TERMINOLOGY

A. Architecture Representation

Module entails of admin login, name, and password that are stored in database. If admin entered incorrect name or password an error message will display in that page. In this module admin can view, add category, area, authorities like Name, Mail id, Mobile number etc. User can add their personal details like Name, Gender, Password, Mail id, Area Location according to admin registered

International Journal for Research in Applied Science & Engineering Technology (IJRASET) ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 6.887 Volume 6 Issue I, January 2018- Available at www.ijraset.com

area and location, can't be add their personal wish. User can change password with the help of Java Object API and update profile, share and view post. SMS will be sent finally in sort of their queries. Cloud computing framework helps in configuring and adjusting the size of storage volumes. It automates the integration, testing and deployment of application components. It work at the level of servers, storage, networks and operate at higher level of platforms.

Fig 2. Architecture Representation

B. Admin module

Two Modules is defined to process, Administrator module and User module. Administrator is responsible for creating Login details, View registered User details, Add category, Add area, Add authority. Admin name and password will store in database. If admin entered incorrect name and password means error message will display in that page. Admin can all the Registered User details. Admin can add category like Irrigation Water supply department and EB department, Sewage water control Board, etc., admin can add area and authorities for corresponding categories. Finally it furnishes the details of the Name, mail id and mobile number.

Fig 4. Progression of Administrator

C. User Module

User can add their personal details like full name, name, and gender, and password, mobile, email and user can add their area and location according to admin registered area and location. User can login with registered name and password if user entered wrong name and password login session won't work. User can change password with help of Java Object API. User should enter registered mobile number and he/she will get Reset code for changing their Password. If user enter wrong code error message display in that page. Updating and Viewing of personal details is applicable. Through Share Post functionality user can feed in tweet box, photo uploading option, category, area, location and so user can text municipal related problem in that tweet box and corresponding photo, area and location. User can do rating for posts if rate score above 3, it will forward for corresponding authorities with help of Java Mail API.

IV.ADVANTAGES

In earlier existing systems, one must visit the office and complaints given through written statement. Based on the priority, the complaint can be submitted in drop box or directly to the commissioner or the concerned department, which may take physical effort and time consuming task. In this existing system, one cannot get any acknowledgement that the complaint has been received. Guarantee for problem solution is given through verbal communication. Hence, it is not meant for problem solution. The main disadvantage of existing system is book reference for all the complaints given by the customers. Hence, it is paper consuming task. There is no complaint acknowledgement given for the user, which is used for future references. People don't get time period for problem recovery.

The main objective is to make easy the process of complaint reporting with very simplified and effective way. This project involves major problem solving modules where these acts as best solution for incoming bulk complaints. For every submission of complaint, the user gets complaint acknowledgement. All these type of acknowledgement is generated by the computer, the solution of time may differ from the type of the complaint and category. To make any complaint, it is made mandatory for the user to mention his contact details, so that it does not receive any anonymous complaint details.

V. CONCLUSION

It's a step towards the smart cities .Using this online application each and every person in the municipality could able to function properly with the help of cloud framework. Effectual Twitter analysis is done to identify the process in minute level. Finally it will help to reduce the bridge between people and government.

VI.ACKNOWLEDGMENT

V.M. Prabhakaran, R. Gayathri, S. Priyadharshini, T.Kathiravan and S. Subbulakshmi wishes to thank the Management, the Director, the Principal, of their institute, KIT-Kalaignarkarunanidhi Institute of Technology, for providing all the necessary facilities and never ending support for the work. We wish to thank their Department Head, Prof. Dr. R. Sukumar for the freedom to pursue research and excellent research ambience provided by him. Our special thanks go to, Prof. Dr. R. Nedunchezhian, Prof. Dr.S. Balamurugan and Prof. Dr. P. Raviraj Pandian for sowing the seeds of thinking big in research, their expert guidance and continuous motivation.
