**Abstract:-**During the work it is common for every machining process to be affected by the vibration. It may be due to many causes like feed, depth of cut, cutting speed and roughness of work piece. Vibration affects the tool life and surface finish of work piece. In this present work composite materials are used to reduce the vibration on a drilling machine. To reduce the vibration glass fibre epoxy and glass fibre polyester are used as a substitute of traditional mild steel bed.

**Keyword:** Vibration, feed, depth of cut, cutting speed, composite material, surface finish, glass fibre epoxy, Glass fibre polyester.

## I. INTRODUCTION

Drilling is the very common process used to make a hole from .2mm to 55mm. During the drilling process vibration occurs. Vibration may occur due to one or more reasons i.e. inhomogeneous material, cutting speed (feed), chip and also due to bed. Surface finishing is affected by vibration and also it reduces tool life. Krishan Mohan Rao et al [1] conducted an experiment analysis of passive damping technique on conventional radial drilling machine tool bed using composite material. It shows composite material has a tendency to reduce vibration.

## III. EXPERIMENTAL SETUP

Fig 1 composite

Fig 2 Experimental setup

As fig 1 show, the specimens of 210x210x5mm are prepared for glass fiber and glass fiber epoxy. Size of mild steel plate is taken as 210x210x5mm. Drill bit is used of 10mm during experiment. Fiber plate used 4-3-2-1 for experiment.fig 2 show the setup.

**IV.RESULTS**

Table 1 experimental data for glass fiber polyester

S.No.	Depth of cut(mm)	Number of layers	Signal amplitude (mV)	Time period (μs)	Frequency (KHz)	RMS Amplitude (mV)
1	3	1	50.1	805.1	1.345	10.2
2	3	2	31.7	490.2	1.78	5.87
3	3	3	21.4	976.2	1.02	5.34
4	3	4	43.3	367.1	2.342	9.7

Table 2 experimental data for glass fiber epoxy

S.No.	Depth of cut(mm)	Number of layers	Signal amplitude (mV)	Time period (μs)	Frequency (KHz)	RMS Amplitude (mV)
1	3	1	30.5	856.9	1.12	5.67
2	3	2	26.8	444.7	1.34	5.01
3	3	3	50.7	523	1.54	8.05
4	3	4	56.9	532	1.43	12.9

Table 3 experimental data for sandwich plates of glass fiber polyester and epoxy

S.No.	Depth of cut(mm)	Number of layers	Signal amplitude (mV)	Time period (μs)	Frequency (KHz)	RMS Amplitude (mV)
1	3	2	55.4	420.2	2.08	12.3
2	3	4	53.8	497.8	1.92	11.8
3	3	6	30.9	659.8	1.53	6.89
4	3	8	46.7	719.6	1.21	11.2

Table 4 experimental data for mild steel

S.No.	Depth of cut(mm)	Number of layers	Signal amplitude (mV)	Time period (μs)	Frequency (KHz)	RMS Amplitude (mV)
1	3	1	55.9	587.3	1.543	13.4

### V. CONCLUSION

In this research we perform many experiments and found that the results are as same as result found by previously by lot of researchers. Use of composite material reduces vibrations of the system as desired. With the increase in number of layer of composite at an optimum level, the vibration is decreased.

The result of experiment show, glass fiber epoxy material can be used for machine tool structure to reduce the undesirable effects of vibration.
