Novel Internet based Patient Monitoring and Diagnosis System using IoT and Sensors

Prabhu P[1], Roopa Shree K[2], Sneha M[3], Ponnuru Sai Sruthi[4]
[1, 2, 3, 4]*Department of Information Science Engineering, New Horizon College of Engineering Outer Ring Road, Bangluru.*

***Abstract:** In today's medical system, IoT uses different types of sensors that help elderly people to make use of modern medical healthcare services anywhere, any time. In today's health care management system, the IoT technology brings together many medical facilities for both doctors and patients. All patient vital data's can be monitored and tracked by the physicians. IoT helps to create a smart transfer method between physician and patient. This project aims to design and demonstrate an innovative web based remote healthcare diagnostic system that provides vital medical data and live video images of a patient situated in rural area accessible to a health professional available elsewhere in urban centres resulting in better diagnosis and treatment of that patient.*

***Keywords:** Temperature Sensors, Medical service, Temperature measurement, Biomedical monitoring, Sensor systems*

I. INTRODUCTION

The Internet of Things (IoT) is a system consisting of computers, machines, objects or even human that has a unique identication number and can also transfer information over the network without man-machine interaction or even man-man interaction. [1] The thing in IOT can be anything like a bio chip, a sensor on an animal, etc. provided with an IP address which has the capability to transfer data over the network. Typically, IoT offers high connectivity of devices, systems, and services that goes beyond machine-to-machine (M2M) communications and covers a variety of protocols, domains, and applications.Health monitoring system is an ongoing research topic among both psychologists and engineers.

Different platform like Microcontrollers are used to design the system based on this performance. Different biomedical sensors like temperature sensor, heart rate sensor, blood pressure sensor are used for monitoring the health condition which is integrated on single system on chip.

If any varied change takes place it is notified. This notification would help to take an appropriate action at an instance of a time. This would save patients from the future health problem which would arise. This would also help patient's concern doctor to take an appropriate action at proper time.

III. PROBLEM STATEMENT

The project Internet Based Patient Monitoring and Diagnosis System" is aiming to monitor the patients' health under various conditions such as people who are in rural areas and patients who are not in critical condition but need to timely monitor by doctor or family.

This project aims to design and demonstrate an innovative web based remote health care diagnostic system that provides vital medical data and live video images of a patient situated in rural area accessible to a health professional available elsewhere in urban centers resulting in better diagnosis and treatment of that patient. Various medical sensors are used to collect patient medical data sent to the monitoring station for interpretation

IV. METHODOLOGY OF PROPOSED SYSTEM:

A. The project aims to design and demonstrate an innovative web based remote healthcare diagnostic system that provides vital medical data of patient situated in rural areas accessible to a health professional available elsewhere in Urban centers resulting in better diagnosis and treatment of that patient

B. Blood Pressure: A digital blood pressure sensor is used to measure patient blood pressure. It consists of an inflatable cuff and an analog pressure sensor circuitry.

C. Pulse rate: Pulse rate is measured from the ECG signal

D. Body Temperature: An analog temperature sensor measures the body temperature

E. Body Position: A3-axis MEMS accelerator sensor measures the body position

F. Health monitoring system use for chronicle diseases patients who have daily checkup.

V. CONCLUSION

This project helps us in detecting the health condition of a person who are in rural areas where they need daily check-up's and know the heart beat rate and blood pressure ,body temperature and body position condition of the person.
