Abstract: Risks have an important impact on construction comes in terms of its primary objectives. Construction comes that are tortuous in nature, uncertainty and risks within the same will develop from completely different sources. The record of the development trade isn't acceptable in terms of header up with risks incomes. Risk management is a process which consists of identification of risks, assessment with qualitatively and quantitatively, response with a suitable method for handling risks, and then control the risks by monitoring. This study proposes to use the risk management technique which has well - documented procedures for the one stop resolution all kinds of hazards possibly to occur throughout any construction project. Keywords: Risk, Risk Management, Construction Projects, Risk Management Process, Monte Carlo Simulation

I. INTRODUCTION

Risk may be outlined because the event that negatively affects the project objectives like time and schedule, cost, quality of labor. Risk Management is that the method of distinguishing the potential risk related to risk and responding to those risks. Risk in any project may be a various rather than fate. According to the characteristic of the development trade, that has high uncertainty, thus it'll occur several risks throughout the development section and our operational building? Risk in construction has been the article of attention owing to time and price over-runs related to construction comes. Risk is a gift all told the activities during a project; it's solely the quantity that varies from one activity to a different. Risks and uncertainties inherent within the industrial area unit quite the other industries. Many industries became a lot of proactive regarding exploitation risk management techniques in project. However, with relevancy the development trade, constant isn't used normally. Risk is an integral component of any project. Risk is a gift all told comes regardless of their size or sector. No project is totally free from risks. If risks are not properly analyses and strategies are not trained to deal with them, the project is likely to lead to failures.

II.OBJECTIVES

The main objectives of this study include the following:

- A. To identify the causes of risk in construction projects.
- B. To identify the approaches for solving the problems regarding risk.
- C. To minimize the effect of risk in construction project

III. METHODOLOGY

In this paper, general focus has been created on the danger factors. The target of this study is to spot the foremost reason behind risk within the construction project and access the relative importance of those causes, from the aspects of construction contractors and consultants. The study was performed on the idea of form, divided into two main components. Half one associated with general info for each the corporate and respondent. Each contractor and consultants were more requested to answer the queries bearing on their expertise in the housing industry. Half two includes the list of known causes of risk in the housing industry on the idea of form distributed arbitrarily to contractors & consultants operating in the construction comes, response were collected. The data gotten inside the survey were poor down by Relative Importance Index (RII) technique. During this paper, general focus has been created with the overall ideas of risk management. Risk identification has been through with the study of literature. A form was developed when the known factors poignant risk. Risk assessments are often through with the help of qualitative and measure. Risk response can be planned with the idea of the result of the study. Risk management is that the last step within the method of risk management.

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.177 Volume 7 Issue VIII, Aug 2019- Available at www.ijraset.com

A. Relative Importance Index (RII)

Assess the relative significance among risks, previous literature work study suggests—establishing a risk significance index by calculating a significance score for each risk. For Calculating the significance score, multiply the probability of occurrence by the degree of Impact. The significance score for each risk assessed by each respondent can be obtained through the model

$$S^i_{j} = A^i_{j} * B^i_{j}$$

Where $S_{j}^{i} = Significance$ score assessed by respondent j for risk i

A j = Occurrence of risk i, assessed by respondent j

Bj = degree of impact of risk I, assessed by respondent j.

By averaging scores from every one of the reactions, it is conceivable to get a normal importance score for each hazard, and this normal score is known as the hazard record score and is utilized for positioning the dangers. The model for the figuring of hazard list score can be characterized as

$$R_{s}^{i} = \sum_{i}^{T} = 1 S_{i}^{i} / T$$

Where R_s^i = index score for risk i

 S_{i}^{i} = Significance score assessed by respondent j for risk i

T= total number of responses

B. Applicability of Test Results to Construction Industry-

Monte Carlo simulation produces distributions of possible outcome values. Monte Carlo simulation provides a number of advantages over deterministic, or "single-point estimate" analysis: Probabilistic Results.

IV. CONCEPT OF RISK ANALYSIS AND MANAGEMENT

Risk management could be a method that identifies the project risks, analyses them, and confirm the actions to avert the threats on any project. All steps within the risk management method ought to be enclosed to handle risks, so as to implement the method of the project. Thanks to the character of construction comes, risk management could be an important method.

Risk associated with construction industry can be broadly categorized into:

S.NO		RISK CATEGORI	IZED					
1.	Technical Risks:	2. Construction Risks:	3.Physical Risks					
	Inadequate specification	Labour productivity	Damage to structure					
	Incomplete design	Rush bidding	Supplies of defective materials					
	Unknown site conditions	Site condition	Labour injuries					
	Investigation Change in scope	Equipment failures	Varied labor and equipment					
	Construction procedures	Design changes						
	Labor shortages	Difference in actual and contract executed quantities	6. Management Risks					
	Errors in design drawing	Lower quality of work	Ambiguous planning due to project complexity					
	Material shortage	Labour productivity	Resource management					
	Industrial disputes		Changes in management ways					
	Incompetence of transportation facilities		Information unavailability					
	wanisportation rathers		Poor communication between parties involved					
4.	Organizational Risks	5. Financial Risks	7. Political Risks					
	Contractual	Monopolizing of materials due to						
		closure and other unexpected	Change of government					
	Relations	Low market demand	Change of government policy					
	Contractor's	Exchange rate fluctuation	Attitudes of participants					
	Experience	Payment delays	7. Environmental Risks					
	Attitudes of participants	Un managed cash flow	Weather implications					
	Inexperienced work	Change in bank formalities and	Natural Disasters					

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.177 Volume 7 Issue VIII, Aug 2019- Available at www.ijraset.com

		lenders

VI. CONCLUSION

Risk management technique seldom utilized by the participants in the construction comes. The participants accustomed to handle the risks with a casual approach. This method isn't used due to less data and awareness among the development business. The danger management technique ought to be applied into any construction project at the initial stage of the project to induce most advantage of the technique. Hence, there's thriving have to be compelled to have a well-documented procedure

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.177 Volume 7 Issue VIII, Aug 2019- Available at www.ijraset.com

that ought to be a one stop answer to any or all hazards that are seeming to occur throughout the project life cycle. There ought to be the additional wholesome approach towards risk management rather than the current irregular approach towards the risks. This research examines the Monte Carlo simulation method and its uses in various fields, focusing primarily on its use in the field of project management. Monte Carlo simulation becomes more popular in project management, more creative studies will propose practical, applicable improvements to current practices and continue to contribute positively to the field. Monte Carlo simulation, once the Monte Carlo simulation technique is thoroughly explained and demonstrated, hands-on experience will allow project managers to realize that the statistical knowledge they are required to apply is quite minimal, and the tools are relatively easy to use once their project network and schedule have been created.
