Isolation and Characterization of the Pharmaceutically Important Naturally Occurring Amine from the Stem of Acacia Nilotica

Dr. Abhay Singh

Associate Professor of Chemistry K.L.P., College, Rewari (India)

Abstract: Acacia are established as very important plants since early times as a source of tannins gums, timber, fuel and fodder. They have pharmacological and toxicological effects. The present work deals with the isolation and characterization of pharmaceutically important naturally occurring amine from the stem of Acacia Nilatica. For isolation of 2-phenylethanamine the stem of Acacia Nilotica was procured and the stem was cut into small pieces and refluxed in methanol on a water bath. The methanol extract was concentrated in atmospheric pressure and then the dark brown viscous liquid so obtained was mixed with silica gel and subjected to coulmn chromatography to isolate the compound. The isolated compound was characterized by using infrared spectra, ¹HNMR spectra and Mass spectra.

I. INTRODUCTION

Acacia is a large genus comprising more than 1000 species belonging to the family Leguminosae, subfamily Mimosoideae. They are distributed in the warm and drier regions of the world mainly in the tropics and subtropics and are more prevalent in Australia and Africa. Acacias are established as very important plant since early times as source of tannins, gums, timber, fuel and fodder. They have significant pharmacological and toxicological effects. Tannins mostly from bark, are extensively used for tanning hides and skins. Some indigenous species like acacia sinuata also yield saponins used traditionally as native soap for washing. Flowers of some species are fragrant. Cassie perfume is obtained from Acacia ferrugenea. The heartwood of many acacias are used for making agricultural implements and also as firewood and are grown near villages for these purposes. Acacia gums find extensive use in medicine and confectionary and as sizing and finishing materials in the textile industry. Lac insects can be grown on several spicies. Acacia nilotica have been used for afforestration of wastelands because it can with stand some water inundation and a few such aras have become bird sanetuaries.

Acacia species are known to be rich source of flavanoids, alkaloids, terpenoids and carbohydrates etc. Chemical analysis of pods from Acacia nilotica wild revealed presence of carbohydrate (47.75%), protein (1.67%) and lipid (1.41%) glucose, galactose, fructose, mal2 tose, aspartic acid, glutaric acid, glycine, alanine, proline, leucine, amine and threonine isolated from seeds (1 - 3). Many acacia species have important uses in traditional medicine. Most of the uses have been shown to have scientific basis, since chemical compounds found in the various species have medicinal effects. In ayurvedic medicine, acacia nilotica is considered a remeady that is helpful for treating premature ejaculation. A 19th century Ethiopian medical text describes a potion made from an Ethiopian species of Acacia mixed with the root of the tacha, then boiled, as a cure for rabies (4). An astringent medicine, called catechu or cutch, is procured from several species, but more especially from acacia catechu, by boiling down the wood and evaporating the solution so as as to get an extract (5).

II. EXPERIMENTAL

All the chemicals used were of AR grade. The adsorbents used were silica gelt (60-120 mesh) and silica gel (G).

- 1) Extraction: The stem of acacia nilotica was cut into small pieces and dried. This material was fefluxed in methanol on a water bath. The methanol extract was concentrated at atmospheric pressure which yielded a dark brown viscous liquid. It was mixed with silica gel and subjected to coulmn chromatography. The isolated compound was further purified by preparatory TLC and was characterized by following spectroscopy techenques.
- 2) Infrared Spectra: Infrared spectra was recorded on (BIORAD FTS 7) infrared spectrophotometer by using potassium bromide pellets.
- 3) $^{1}HNMR$ Spectra: The $^{1}HNMR$ spectra of the compound was recorded in CDCl₃ on a Bruker 300 (300 MHz) nuclear magnetic resonance spectrometer using tetramethyl silane (TMS) as internal standard at sophisticated analytical shifts are in \Box , ppm scale.
- 4) Mass Spectra: The mass spectra of the compound was recorded on a SHIMDZU QP-5000 spectrometer.

III. RESULTS AND DICUSSION

Acacia nilotica is widely distributed in India on road side and forests. Its compound reported to have central nervous system despressant activity.

Previous phytochemical work on the plant reported the isolation of flavan glycoside, three isomeric flavan - 3,4-diols, amines, a dihydroflavanol, flavanone, flavonal and polymeric polyphenols.

The isolation and characterization of the pharmacentically important naturally occurring amine i.e. 2-phenylethanamine from the stem of the plant has been established as follows.

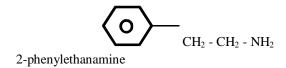

The methanol extract of powdered stem of acacia nilotica on chromatographic purification on silica gel coulmn yielded an amine portion.

The compound shows three peaks in I.R. spectrum at 3400 cm⁻¹, 3060 cm⁻¹ and 2960 cm⁻¹ which from literature corresponds to the presence of -NH₂ group, one phenyl ring and last is due to -CH₂- unsymmetrical stetching.

The 1 HNMR spectrum of the compound shows a singlet at \Box -3.4 due to 2H of amino group. The two protons on C-2 produced a signal in the form of multiplet at \Box 2.75 due to hydrogen of C-1. The dublet at \Box 2.61 due to hydrogen of C-1. The methylene proton being adjacent to the electronegative nitrogen atom, resonant at lower field. The unsymmetrical pattern at \Box 6.8 - 6.55 due to H of aromatic ring.

A base peak at m/z 30 and another peak at m/z 70 indicate the primary amine and phenyl present as the side chain.

On the basis of I.R. ¹HNMR and mass spectral data, following struture is assigned to the compound 2-phenylethanamine.
