#### Abstract

Let $G(V, E)$ be a graph. A dominating set is a subset $S$ of $V$ such that every vertex not in $S$ is adjacent to at least one vertex in $S$. The cardinality of a minimum dominating set is called the domination number, $\gamma(G)$. A dominating set with $\gamma v e r t i c e s$ is called a $\gamma$-set. Let $\eta$ denote the number of $\gamma$-sets in $G$. For a graph $G$, the splitting graph $S(G)$, is obtained by adding a new vertex $v$ 'corresponding to each vertex $v$ of $G$ and joining $v$ 'to all vertices which are adjacent to $v$ in $G$. Here we introduce a new type of graphs called minimum domination splitting graphs or simply $\gamma$ splitting graphs. Let $G$ be a graph and let $S_{l}, S_{2}, \ldots, S_{\eta}$ be the $\gamma$-sets in $G$. The $\gamma$-splitting graph, $S_{\gamma}(G)$, of a graph $G$ is the graph obtained from $G$ by adding new vertices $w_{1}, w_{2}, \ldots, w_{\eta}$ and joining $w_{i}$ to each vertex in $S_{i}$ where $1 \leq i \leq \eta$. In this paper, we establish some results on $\gamma$-splitting graphs.

Keywords: Dominating set, domination number, splitting graph, $\gamma$-splitting graph.

## I. INTRODUCTION

Throughout this paper, we consider only finite, simple, undirected graphs. For notations and terminology we follow [3]. Let G(V,E) be a graph of order n . We denote the cycle on n vertices by $\mathrm{C}_{\mathrm{n}}$, the path of n vertices by $\mathrm{P}_{\mathrm{n}}$, and the complete graph on n vertices by $K_{n}$. The complete bipartite graph is denoted by $K_{m, n}$. In a graph $G$, degree of a vertex $v$ is denoted by $d(v)$. If $S$ is a subset of $V$, then $\langle S>$ denotes the vertex induced subgraph of $G$ induced by $S$. For any vertex $v \in V(G)$, the open neighbourhood $N(v)$ of $V(G)$ is the set of all vertices adjacent to $v$, that is, $N(v)=\{u \in V(G) / u v \in E(G)\}$, and the closed neighbourhood of $v$ is defined by $N[v]=N(v)$ $\bigcup\{\mathrm{v}\} . \mathrm{N}^{\mathrm{c}}(\mathrm{v})=\mathrm{V}-\mathrm{N}(\mathrm{v})$ is called the neighbourhood complement. For any set $\mathrm{S}, \mathrm{N}(\mathrm{S})=\bigcup_{v \in S} N(v)$.
A full vertex of $G$ is a vertex in $G$ which is adjacent to all other vertices of $G$. A graph $G$ is said to be $r$-regular if every vertex in $G$ is of degree r . For any two integers k and $\mathrm{d}, \mathrm{k} \neq \mathrm{d}, \quad \mathrm{a}(k, d)$ - biregular graph is a graph in which every vertex is of degree either k or d . For any three integers $\mathrm{x}, \mathrm{a}$, and $\mathrm{b}, \mathrm{x} \neq \mathrm{a} \neq \mathrm{b}, \mathrm{a}(x, a, b)$ - triregular graph is a graph in which every vertex is of degree either x or a or b . For example, a (2,3)-biregular and a (1,2,6)- triregular graphs are shown in Figure 1.

(2,3)-biregular

(1,2,6)- triregular

Figure 1
The distance $\mathrm{d}(\mathrm{u}, \mathrm{v})$ in G between two vertices u and v is the length of a shortest $\mathrm{u}-\mathrm{v}$ path in G . The eccentricity $\mathrm{e}(\mathrm{u})$, of a vertex u is the distance of a farthest vertex from $u$, and radius $\operatorname{rad}(G)$ of $G$ is the minimum eccentricity. The maximum distance between any two vertices in $G$ is the diameter of $G$, denoted by $\operatorname{diam}(G)$, that is, $\operatorname{diam}(G)=\max _{u, v \in V(G)}\{d(u, v)\}$. A vertex u with $\quad e(u)=\operatorname{rad}(G)$ is called a central vertex. A graph $G$ for which $\operatorname{rad}(G)=\operatorname{diam}(G)$ is called a self-centered graph of radius rad(G). Or equivalently, a graph is self-centered if all of its vertices are central vertices. For further basic definitions on distance in graphs one can refer [4].
Let $H_{n, n}$ denote the graph with vertex set $\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots, \mathrm{v}_{\mathrm{n}} ; \mathrm{u}_{1}, \mathrm{u}_{2}, \ldots, \mathrm{u}_{\mathrm{n}}\right\}$ and edge set $\left\{\mathrm{v}_{\mathrm{i}} \mathrm{u}_{\mathrm{j}} / \quad 1 \leq \mathrm{i} \leq \mathrm{n}, \mathrm{n}-\mathrm{i}+1 \leq \mathrm{j} \leq \mathrm{n}\right\}$. The graph $\mathrm{B}_{\mathrm{m}, \mathrm{n}}$ is the bistar obtained from the stars $\mathrm{K}_{1, \mathrm{~m}}$ and $\mathrm{K}_{1, \mathrm{n}}$ by joining their central vertices by means of an edge. For example, the graph $\mathrm{H}_{4,4}$

## International Journal for Research in Applied Science \& Engineering Technology (IJRASET)

and the bistar $\mathrm{B}_{4,5}$ are shown in Figure 2.

$\mathrm{H}_{4}, 4$

$\mathbf{B}_{4,5}$

Figure 2
The join $\mathrm{G} \vee \mathrm{H}$ of the graph G and H is the graph obtained from $\mathrm{G} \bigcup \mathrm{H}$ by joining every vertex of G to each vertex of H by means of an edge. The graph $\mathrm{W}_{\mathrm{n}}=\mathrm{C}_{\mathrm{n}-1} \vee \mathrm{~K}_{1}$ is called the wheel graph on n vertices. The corona $\mathrm{G} \circ \mathrm{H}$ of two graphs G and H is obtained by taking one copy of G and $|V(G)|$ copies of H , and by joining each vertex in the $\mathrm{i}^{\text {th }}$ copy of H to the $\mathrm{i}^{\text {th }}$ vertex of G , where $1 \leq \mathrm{i} \leq$ $|V(G)|$. The corona graph $\mathrm{C}_{5} \circ \mathrm{~K}_{2}$ is depicted in Figure 3, for reference,

Figure 3
In a graph G , the process of deleting an edge uv and introducing a new vertex w and the edges uw and vw is called the subdivision of the edge uv . A spider is a tree on $2 \mathrm{n}+1$ vertices obtained by subdividing each edge of a star $\mathrm{K}_{1, n}$. In other words, spider is nothing but $\mathrm{K}_{1, \mathrm{n}}{ }^{\circ} \mathrm{K}_{1}$. A wounded spider is a graph obtained from subdividing at most $\mathrm{n}-1$ edges of a star $\mathrm{K}_{1, \mathrm{n}}$. The wounded spider includes $\mathrm{K}_{1}$, the star $\mathrm{K}_{1, \mathrm{n}-1}$. For example, a wounded spider G the graph shown in Figure 4. The cartesian product of two graphs $\mathrm{G}_{1}$ and $G_{2}$ is denoted by $G_{1} \times G_{2}$. The graph $K_{1, m} \times P_{2}$ is called the $m$-book graph and it is denoted by $B_{m}$. For example, the book graph $B_{4}$ is shown in Figure 5 .

Figure 4
Figure 5
A dominating set is a subset S of the vertex set V such that every vertex is either in S or adjacent to a vertex in S , that is, such that every vertex in V-S is adjacent to at least one vertex in S . The domination number is the number of vertices in a smallest dominating set of $G$, it is denoted by $\gamma(\mathrm{G})$. A dominating set with $\gamma$ elements is called a $\gamma$-set. For example, $\mathrm{S}_{1}=\{\mathrm{b}, \mathrm{d}\}$ and $\mathrm{S}_{2}=\{\mathrm{a}, \mathrm{c}\}$ are the minimum dominating sets of the graph G can be verified in Figure 6. For further results on domination in graphs, one can refer [5].

## G

## Figure 6

Note that $S_{3}=\{a, b, c, d, e, f, \mathrm{f}, \mathrm{h}\}$ and $\mathrm{S}_{4}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$, etc., are also dominating sets in G . The concept of splitting graph was introduced by Sampath Kumar and Walikar [6]. The splitting graph $\mathrm{S}(\mathrm{G})$, is the graph obtained from G, by adding a new vertex w for every vertex $\quad v \in V(G)$, and joining $w$ to all vertices of $G$ adjacent to $v$. For example, a graph $G$ and its splitting graph $S(G)$ are shown in Figure 7.

G

$\mathbf{S}(\mathbf{G})$

Figure 7
The concept of cosplitting graphs has been recently introduced by Selvam Avadayappan and M. Bhuvaneshwari [1]. Let G be a graph with vertex set $\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots, \mathrm{v}_{\mathrm{n}}\right\}$. The cosplitting graph $\mathrm{CS}(\mathrm{G})$ is the graph obtained from G , by adding a new vertex $\mathrm{w}_{\mathrm{i}}$ for each vertex $v_{i}$ and joining $w_{i}$ to all vertices which are not adjacent to $v_{i}$ in $G$. As an illustration, a graph $G$ and its cosplitting graph $C S(G)$ are shown in Figure 8.

## International Journal for Research in Applied Science \& Engineering Technology (IJRASET)

The concept of $\beta$-splitting graph has been introduced by Selvam Avadayappan,
M. Bhuvaneshwari and B. Vijaya Lakshmi [2]. Let $S_{1}, S_{2}, \ldots, S_{\rho}$ be the maximum independent sets of $G$. The $\beta$-splitting graph $S_{\beta}(G)$ of a graph $G$ is a graph obtained from $G$ by adding new vertices $w_{1}, w_{2}, \ldots, w_{\rho}$ such that each $w_{i}$ is adjacent to each vertex in $S_{i}$, for $1 \leq i \leq \rho$. For example, a graph $G$ and its $\beta$ splitting graph $S_{\beta}(G)$ are shown in Figure 9.

In this paper, we introduce a new type of splitting graphs called $\gamma$ - splitting graphs. Let G be a graph and let $\eta$ be the number of $\gamma$ sets in G. Let $S_{1}, S_{2}, \ldots, S_{\eta}$ be the minimum dominating sets in G. The $\gamma$-splitting graph, $S_{\gamma}(G)$, of a graph $G$ is the graph obtained from $G$ by adding new vertices $w_{1}, w_{2}, \ldots, w_{\eta}$ and joining $w_{i}$ to each vertex in $S_{i}$ where $1 \leq i \leq \eta$. For example, the $\gamma$ - splitting graph of $\mathrm{P}_{4}$ is shown in Figure 10.

Figure 10

Clearly, $S_{1}=\left\{\mathrm{v}_{1}, \mathrm{v}_{4}\right\}, \mathrm{S}_{2}=\left\{\mathrm{v}_{2}, \mathrm{v}_{3}\right\}, \mathrm{S}_{3}=\left\{\mathrm{v}_{1}, \mathrm{v}_{3}\right\}, \mathrm{S}_{4}=\left\{\mathrm{v}_{2}, \mathrm{v}_{4}\right\}$ are the $\gamma$-sets in $\mathrm{P}_{4}$, also $\mathrm{w}_{1}, \mathrm{w}_{2}, \mathrm{w}_{3}, \mathrm{w}_{4}$ are newly added vertices in $\mathrm{S}_{\gamma}\left(\mathrm{P}_{4}\right)$. Here, we discuss a few results on $\gamma$-splitting graphs. In this paper, we independently characterise graphs for which $\mathrm{S}_{\gamma}(\mathrm{G})$ is a regular, biregular, tree, unicyclic graph. We attain bounds for the maximum and minimum degree of a vertex in $S_{\gamma}(G)$. Finally we study the distance properties of $\gamma$-splitting graphs.

## II. CHARACTERISATION OF $\gamma$-SPLITTING GRAPHS

The following facts can be easily verified for $\gamma$-splitting graphs. For a vertex $v$ in $S_{\gamma}(G)$, let $d^{*}(v)$ denote the degree of $v$ in $S_{\gamma}(G)$.
Fact 2.1 The newly added vertices $\left\{w_{1}, w_{2}, \ldots, w_{\eta}\right\}$ are independent in $S_{\gamma}(G)$, that is, $d\left(w_{i}, w_{j}\right) \geq 2$, for any $i, j, 1 \leq i, j \leq \eta$.
Fact $2.2 \mathrm{~d}^{*}\left(\mathrm{w}_{\mathrm{i}}\right)=\gamma(\mathrm{G})$, for $\mathrm{i}, 1 \leq \mathrm{i} \leq \eta$.
Fact 2.3 For any vertex $\mathrm{v} \in \mathrm{V}(\mathrm{G}), \mathrm{d}(\mathrm{v}) \leq \mathrm{d}^{*}(\mathrm{v})$.
Fact 2.4 Every graph $G$ is an induced subgraph of $S_{\gamma}(G)$. Even more $G$ is a proper subgraph of $S_{\gamma}(G)$, since every graph contains at least one $\gamma$-set.
Fact 2.5 The graph having only one full vertex, bistar graph, the graph $H_{n, n}$, the path $P_{3 k}, k \geq 1$ and the book graph $B_{m}$ are some

## International Journal for Research in Applied Science \& Engineering Technology (IJRASET)

graphs whose $\gamma$-splitting graphs contain exactly one newly added vertex.

Fact $2.6 \mathrm{~S}_{\gamma}\left(\mathrm{K}_{\mathrm{n}}\right) \cong \mathrm{K}_{\mathrm{n}} \circ \mathrm{K}_{1}$ for any $\mathrm{n} \geq 1$.
Fact 2.7 $\mathrm{S}_{\gamma}\left(\mathrm{K}_{1, \mathrm{n}}\right) \cong \mathrm{K}_{1, \mathrm{n}+1}$ for any $\mathrm{n} \geq 2$.
Fact $2.8 \mathrm{~S}_{\gamma}\left(\mathrm{K}_{\mathrm{n}}{ }^{\mathrm{c}}\right) \cong \mathrm{K}_{1, \mathrm{n}}$ for any $\mathrm{n} \geq 1$.
The following theorems establish some properties of $\gamma$-splitting graphs.
Proposition 2.9 For any $\mathrm{m} \geq 1$ and $\mathrm{n} \geq 1, \eta\left(\mathrm{~K}_{\mathrm{m}, \mathrm{n}}\right)= \begin{cases}1 & \text { if } \mathrm{m}=1, \mathrm{n} \geq 2 \\ 2 & \text { if } \mathrm{m}=\mathrm{n}=1 \\ 6 & \text { if } \mathrm{m}=\mathrm{n}=2 \\ m n+1 & \text { if } \mathrm{m}=2, \mathrm{n}>2 \\ m n & \text { if } \mathrm{m} \geq 3, \mathrm{n} \geq 3 .\end{cases}$
Proof Let $V=\left\{u_{1}, u_{2}, \ldots, u_{m} ; v_{1}, v_{2}, \ldots, v_{n}\right\}$ be the vertex set of $K_{m, n}$.
Case (i) Suppose $m=n=1$, then clearly $\left\{u_{1}\right\}$ and $\left\{v_{1}\right\}$ are only the $\gamma$-sets and hence $\eta\left(K_{m, n}\right)=2$.
Case (ii) If $m=n=2$, then clearly $\left\{u_{1}, v_{1}\right\},\left\{u_{2}, v_{2}\right\},\left\{u_{1}, v_{2}\right\},\left\{u_{2}, v_{1}\right\},\left\{u_{1}, u_{2}\right\}$ and $\left\{\mathrm{v}_{1}, \mathrm{v}_{2}\right\}$ are the only $\quad \gamma$-sets in $K_{2,2}$ and hence $\eta\left(\mathrm{K}_{m, n}\right)$ $=6$.
Case (iii) If $m=1$ and $n \geq 2$, then $G \cong K_{1, n}$, and therefore $\left\{u_{1}\right\}$ is the only $\gamma$-set. That is, $\eta(G)=1$.
Case (iv) Suppose $m=2$ and $n>2$. Then $\left\{u_{1}, u_{2}\right\}$ and $\left\{u_{j}, v_{k}\right\} 1 \leq j \leq 2,1 \leq k \leq n$ are the $\gamma$-sets of G. Thus $\eta\left(K_{m, n}\right)=m n+1$.
Case (v) If $m \geq 3$ and $n \geq 3$, then clearly $\left\{u_{i}, v_{k}\right\} 1 \leq i \leq m, 1 \leq k \leq n$. Thus $\eta\left(K_{m, n}\right)=m n$.
Theorem 2.10 For any $n \geq 1$, there exists a graph $G$ of order $n$, such that $S_{\gamma}(G)$ is n-regular.
Proof When $n=1, G \cong K_{1}$, for which $S_{\gamma}(G) \cong K_{2}$ is the required graph. Therefore assume that $\quad n \geq 2$, consider the graph $G \cong K_{n} \cup$ $K_{n-1}^{c}$ with vertex set $\left\{v_{1}, v_{2}, \ldots \ldots, v_{n} ; u_{1}, u_{2}, \ldots, u_{n-1}\right\}$ with edge set $\left\{v_{i} v_{j} / 1 \leq i, j \leq n\right\}$. For any $i, 1 \leq i \leq n$, clearly $\left\{v_{i}, u_{1}, u_{2}, \ldots \ldots ., u_{n-1}\right\}$ is a $\gamma$-set of $G$, that is, $\gamma(\mathrm{G})=\mathrm{n}$. Hence there are n such $\gamma$-sets in $G$. Let $\mathrm{w}_{1}, \mathrm{w}_{2}, \ldots, \mathrm{w}_{\mathrm{n}}$ be the newly added vertices in $\mathrm{S}_{\gamma}(\mathrm{G})$. Now for any $\mathrm{i}, \mathrm{j}, 1 \leq \mathrm{i} \leq \mathrm{n}, 1 \leq \mathrm{j} \leq \mathrm{n}-1$. Thus $\mathrm{d}^{*}\left(\mathrm{v}_{\mathrm{i}}\right)=\mathrm{d}^{*}\left(\mathrm{w}_{\mathrm{i}}\right)=\mathrm{d}^{*}\left(\mathrm{u}_{\mathrm{j}}\right)=\mathrm{n}$. Hence $\mathrm{S}_{\gamma}(\mathrm{G})$ is n -regular. Thus $G$ is the required graph. For example, the graph $K_{3} \cup K_{2}{ }^{c}$ and $S_{\gamma}\left(K_{3} \cup K_{2}{ }^{\text {c }}\right.$ ) which is a 3-regular graph are shown in Figure 11.

Figure

Now, consider the star graph $\mathrm{K}_{1, \mathrm{n}-1}, \mathrm{n} \geq 3$, which is biregular. In addition $\mathrm{S}_{\gamma}\left(\mathrm{K}_{1, \mathrm{n}-1}\right)$ is also biregular. This shows that there are biregular graphs $G$ whose $S_{\gamma}(\mathrm{G})$ are also biregular. Some examples are listed below:

## International Journal for Research in Applied Science \& Engineering Technology (IJRASET)

| Graph G | Degree set of G | $\mathrm{S}_{\gamma}(\mathrm{G})$ | Degree set of $\mathrm{S}_{\gamma}(\mathrm{G})$ |
| :---: | :---: | :---: | :---: |
| $\mathrm{K}_{1, \mathrm{n}-1}, \mathrm{n} \geq 3$ | $\{1, \mathrm{n}-2\}$ | $\mathrm{K}_{1, \mathrm{n}}$ | $\{1, \Delta(\mathrm{G})+1\}$ |
| $\mathrm{P}_{5}$ | $\{1,2\}$ | $\mathrm{S}_{\gamma}\left(\mathrm{P}_{5}\right)$ | $\{2, \Delta(\mathrm{G})+2\}$ |
| $\mathrm{B}_{\mathrm{m}}$ | $\{2, \mathrm{~m}+1\}$ | $\mathrm{S}_{\gamma}\left(\mathrm{B}_{\mathrm{m}}\right)$ | $\{2, \Delta(\mathrm{G})+1\}$ |

Theorem 2.11 The graph $S_{\gamma}\left(K_{m, n}\right)$ is biregular if $m=n$ and $S_{\gamma}\left(K_{m, n}\right)$ is triregular if $m \neq n$ for $m \geq 2$.
Proof Let $V=\left\{v_{1}, v_{2}, \ldots, v_{m} ; u_{1}, u_{2}, \ldots, u_{n}\right\}$ be the vertex set of $K_{m, n}$.
Case (i) Suppose $m=n$, and $m \geq 3$. The graph $S_{\gamma}\left(K_{m, m}\right)$, then $d^{*}\left(w_{i}\right)=2$. Also, by Proposition $1, \eta=m^{2}$. Each $u_{i}$ or $v_{i}$ belongs to exactly $\mathrm{m} \gamma$-sets. Hence $\mathrm{d}^{*}\left(\mathrm{u}_{\mathrm{i}}\right)=\mathrm{d}^{*}\left(\mathrm{v}_{\mathrm{i}}\right)=2 \mathrm{~m}$. Then $\mathrm{S}_{\gamma}\left(\mathrm{K}_{\mathrm{m}, \mathrm{m}}\right)$ is a $(2 \mathrm{~m}, 2)$-biregular graph when $\mathrm{m}=\mathrm{n}$.

Case (ii) Let $m \neq n$. The graph $S_{\gamma}\left(K_{m, n}\right)$, then $d^{*}\left(w_{i}\right)=2$, and $\eta=m n$. Each $u_{i}$ belongs to $n \gamma$ - sets and each $v_{i}$ belongs to $m \gamma$-sets. Then $d^{*}\left(u_{i}\right)=2 n$ and $d^{*}\left(v_{i}\right)=2 m$. Hence $S_{\gamma}\left(K_{m, n}\right)$ is a $(2 m, 2 n, 2)$-triregular graph when $m \neq n$. Hence the proof. For example, the graph $\mathrm{K}_{2,2}$ and $\mathrm{S}_{\gamma}\left(\mathrm{K}_{2,2}\right)$ are shown in Figure 12.

Figure 12
Theorem 2.12 The graph $\mathrm{S}_{\gamma}(\mathrm{G})$ is a tree if and only if G is one among the following graphs $\mathrm{K}_{\mathrm{n}}{ }^{\mathrm{c}}, \mathrm{P}_{2},\left(\bigcup_{i=1}^{k} K_{1, n_{i}}\right) \bigcup \mathrm{K}_{\mathrm{m}}{ }^{\mathrm{c}}, \mathrm{k} \geq 1, \mathrm{n}_{\mathrm{i}}$ $\geq 2, \mathrm{~m} \geq 1$, or $\bigcup_{i=1}^{k} K_{1, n_{i}}, \mathrm{k} \geq 1, \mathrm{n}_{\mathrm{i}} \geq 2$.
Proof Consider a graph $G$ for which $S_{\gamma}(G)$ is a tree. Since $G$ is an induced subgraph of $S_{\gamma}(G)$, $G$ is acyclic. If $G$ contains only two vertices, then obviously $G \cong K_{2}$ or $K_{2}{ }^{c}$ for which $S_{\gamma}(G) \cong P_{4}$ or $P_{3}$ respectively. So we assume that $G$ contains at least three vertices. Case (i) Suppose $G$ is a tree. Then $G$ contains at most one full vertex. If $G$ contains only one full vertex, then $G \cong K_{1 . n}$ for which $\mathrm{S}_{\gamma}(\mathrm{G}) \cong \mathrm{K}_{1, \mathrm{n}+1}$. If G contains no full vertex, then $\gamma(\mathrm{G})>1$ and thus G contains at least two vertices $u$ and $v$ in any $\gamma$-set $S$ of $G$. Let $w$ be the newly added vertex in $S_{\gamma}(G)$, corresponding to $S$. Now the $u-v$ path together with the edges uw and wv forms a cycle in $S_{\gamma}(G)$, which is a contradiction to our assumption that $S_{\gamma}(G)$ is a tree. Therefore, this case does not arise.
Case (ii) Let $G$ be a forest. If a $\gamma$-set contains at least two vertices in the same component, then $S_{\gamma}(G)$ contains a cycle, which is a contradiction. Therefore every component must contain exactly one vertex of each $\gamma$-set of $G$, which is possible when each

## International Journal for Research in Applied Science \& Engineering Technology (IJRASET)

component is a star or a trivial graph and hence $\mathrm{G} \cong\left(\bigcup_{i=1}^{k} K_{1, n_{i}}\right) \cup \mathrm{K}_{\mathrm{m}}{ }^{\mathrm{c}}, \mathrm{k} \geq 1, \mathrm{n}_{\mathrm{i}} \geq 2$ and $\mathrm{m} \geq 1$ or $\mathrm{G} \cong \bigcup_{i=1}^{k} K_{1, n_{i}}, \mathrm{k} \geq 1, \mathrm{n}_{\mathrm{i}} \geq 2$. And the converse is obvious.

For example, the graph $\mathrm{S}_{\gamma}\left(\bigcup_{i=1}^{3} K_{1,3}\right)$ and $\mathrm{S}_{\gamma}\left(\left(\bigcup_{i=1}^{2} K_{1,3}\right) \cup \mathrm{K}_{3}{ }^{\mathrm{c}}\right)$ are shown in Figure 13.

Figure 13
Let $P_{k}(m, n)$, where $k \geq 2$ and $m, n \geq 1$, be the graph obtained by identifying the centre vertices of the stars $K_{1, m}$ and $K_{1, n}$ at the ends of $P_{k}$ respectively. The graph $C_{3}\left(m_{1}, m_{2}, m_{3}\right)$, where $m_{i} \geq 0$, is obtained from the cycle $C_{3}=v_{1} v_{2} v_{3} v_{1}$ by identifying the centre of the star $K_{1, m_{i}}$, at $v_{i}$ of $C_{3}$, for $1 \leq i \leq 3$. For example, the graph $P_{5}(3,4)$ and $C_{3}(3,0,0)$ are shown in Figure 14 .

## Figuer 14

Theorem 2.13 The graph $S_{\gamma}(G)$ is unicyclic if and only if $G$ is isomorphic to any one of the following graphs: (i) $P_{2} \bigcup K_{1}$, (ii) $K_{3}$, (iii) $B_{m, n}, m>1, n>1$, (iv) $P_{k}(m, n), k=3,4$ and $m, n \geq 1$, (v) $B_{m, n} \cup K_{t}^{c}, m>1, n>1, t \geq 1$, (vi) $P_{k}(m, n) \cup K_{t}, k=3,4$ and $\mathrm{m}, \mathrm{n} \geq 1, \mathrm{t} \geq 1, \quad$ (vii) $\mathrm{C}_{3}\left(\mathrm{~m}_{1}, 0,0\right) \bigcup_{p=0}^{r} p K_{1, n} \bigcup_{q=0}^{s} q K_{n}^{c}$ where $\mathrm{m}_{1} \geq 1$.
Proof Consider the graph G for which $\mathrm{S}_{\gamma}(\mathrm{G})$ is unicyclic. Then there arise two cases.
Case (i) Suppose G is acyclic. Then clearly the cycle contains a newly added vertex w in $\mathrm{S}_{\gamma}(\mathrm{G})$. Therefore, $\gamma(\mathrm{G}) \neq 1$. Let G be a connected graph. Then $\eta=1$, that is, G contains exactly one $\quad \gamma$-set, since every newly added vertex forms a new cycle. In particular, $\gamma(\mathrm{G})=2$ with the $\gamma$-set $\{\mathrm{u}, \mathrm{v}\}$. Let w be the newly added vertex in $\mathrm{S}_{\gamma}(\mathrm{G})$. Then the (u,v)-path in G together with the newly added edges wu and vw forms the unique cycle in $S_{\gamma}(G)$, this is possible only when $\quad G \cong B_{m, n}, m>1, n>1, P_{k}(m, n), k=3,4$ and $\mathrm{m}, \mathrm{n} \geq 1$.
Let G be disconnected. If G has more than one component, with at least one edge, then $\mathrm{S}_{\gamma}(\mathrm{G})$ has more cycles, which is a contradiction to our assumption that $S_{\gamma}(G)$ is unicyclic. Hence only one component $G_{1}$ of $G$ can contain edges and the others are isolated vertices. If $G_{1}$ contains only one edge, then $G$ must be $P_{2} \cup K_{1 .}$ If $G_{1}$ contains more than one edge, then $G_{1}$ is isomorphic to $\mathrm{B}_{\mathrm{m}, \mathrm{n}}, \mathrm{m}>1, \mathrm{n}>1, \mathrm{P}_{\mathrm{k}}(\mathrm{m}, \mathrm{n}), \mathrm{k}=3,4$ and $\mathrm{m}, \mathrm{n} \geq 1$ and hence $\mathrm{G} \cong \mathrm{B}_{\mathrm{m}, \mathrm{n}} \cup \mathrm{K}_{\mathrm{t}}^{\mathrm{c}}, \mathrm{m}>1, \mathrm{n}>1, \mathrm{t} \geq 1, \mathrm{P}_{\mathrm{k}}(\mathrm{m}, \mathrm{n}) \cup \mathrm{K}_{\mathrm{t}}^{\mathrm{c}}, \mathrm{k}=3,4$ and $\mathrm{m}, \mathrm{n} \geq 1$, $t \geq 1$.
Case (ii) Suppose G is unicyclic. Let G be a connected graph. Then newly added edges cannot be in a cycle. This is possible only

# International Journal for Research in Applied Science \& Engineering Technology (IJRASET) 

when $\gamma(G)=1$. This forces that $G \cong K_{3}$ or $C_{3}\left(m_{1}, 0,0\right)$ where $m_{1} \geq 1$.
Let G be disconnected graph. Then $\omega(\mathrm{G}) \geq 2$. Clearly, one of the component of G is unicyclic and the remaining are trees. Since every component is connected, by the above argument exactly one vertex of each component belongs to $\gamma$-set of G. Also, the $\gamma$-set must be unique to avoid cycles formed by newly added vertices. Such a graph is isomorphic to $\mathrm{C}_{3}\left(\mathrm{~m}_{1}, 0,0\right) \bigcup_{p=0}^{r} p K_{1, n} \bigcup_{q=0}^{s} q K_{n}^{c}$ where $m_{1} \geq 1$. And the converse is obvious.
For example, the graphs $\mathrm{S}_{\gamma}\left(\mathrm{B}_{4,5} \cup \mathrm{~K}_{3}{ }^{c}\right)$ and $\mathrm{S}_{\gamma}\left(\mathrm{C}_{3}(3,0,0) \bigcup \mathrm{K}_{1,4} \bigcup \mathrm{~K}_{3}{ }^{c}\right.$ ) are shown in Figure 15.

Figure

Theorem 2.14 Let $G$ be a graph. Then $S_{\gamma}(G)$ has a full vertex if and only if $G \cong K_{n}{ }^{c}$ or $H \vee K_{1}$ where $H$ is a graph without a full vertex.
Proof Let $\mathrm{w}_{\mathrm{i}}$ be the newly added vertices in $\mathrm{S}_{\gamma}(\mathrm{G})$ for $1 \leq \mathrm{i} \leq \eta$. Let v be a full vertex in $\mathrm{S}_{\gamma}(\mathrm{G})$.
Case (i) Suppose $v$ is a newly added vertex. Since $w_{i}^{\prime}$ 's are all independent in $S_{\gamma}(G), v$ is the only newly added vertex. And hence $V(G)$ is the only dominating set of $G$. This is possible only when $G \cong K_{n}{ }^{c}$.
Case (ii) Let $\mathrm{v} \in \mathrm{V}(\mathrm{G})$. Then v is a full vertex of G . If G has a full vertex u other then v , then there are $\mathrm{w}_{1}$ and $\mathrm{w}_{2}$ corresponding to the $\gamma$-sets $\{u\}$ and $\{v\}$. But $w_{1}$ and $w_{2}$ are not adjacent. In addition $u_{2}$ and $\mathrm{vw}_{1}$ are not the edges in $\mathrm{S}_{\gamma}(\mathrm{G})$. Thus $\mathrm{S}_{\gamma}(\mathrm{G})$ contains no full vertices, a contradiction. Therefore, $G$ has exactly one full vertex. In other words, $G \cong H \vee K_{1}$ where $H$ has no full vertex.
Conversely, assume that $\mathrm{G} \cong \mathrm{H} \vee \mathrm{K}_{1}$. The graph $\mathrm{S}_{\gamma}(\mathrm{G})$ is nothing but a graph obtained from $\mathrm{H} \vee \mathrm{K}_{1}$ by adding a new vertex and join it to the vertex of $\mathrm{K}_{1}$. Also $\mathrm{S}_{\gamma}\left(\mathrm{K}_{\mathrm{n}}{ }^{\mathrm{c}}\right) \cong \mathrm{K}_{1, \mathrm{n}}$. In both the cases, $\mathrm{S}_{\gamma}(\mathrm{G})$ has a full vertex. Hence the proof.
Proposition 2.15 For any connected graph $\mathrm{G}, \Delta(\mathrm{G}) \leq \Delta\left(\mathrm{S}_{\gamma}(\mathrm{G})\right) \leq \max \{\Delta(\mathrm{G})+\eta, \gamma\}$.
Proof Let v be a vertex of maximum degree in $\mathrm{S}_{\gamma}(\mathrm{G})$. If v is a newly added vertex, then $\quad \Delta\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)=\gamma$. Otherwise, if $\mathrm{v} \in$ $\mathrm{V}(\mathrm{G})$, then there arise two cases. When $\mathrm{v} \notin \bigcup S_{i}, 1 \leq \mathrm{i} \leq \eta$, then $\Delta\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)=\Delta(\mathrm{G})$. When $\mathrm{v} \in \bigcap S_{i}, 1 \leq \mathrm{i} \leq \eta, \Delta\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)=\Delta$ (G) $+\eta$. Hence the maximum degree of the graph $\mathrm{S}_{\gamma}(\mathrm{G})$ varies as, $\Delta(\mathrm{G}) \leq \Delta\left(\mathrm{S}_{\gamma}(\mathrm{G})\right) \leq \max \{\Delta(\mathrm{G})+\eta, \gamma\}$. Hence the proof. For any $\mathrm{n} \geq 6$, there exists a graph of order n with $\Delta\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)=\gamma(\mathrm{G}), \mathrm{P}_{3 \mathrm{k}}, \mathrm{k} \geq 2$ is one such a graph. Also the spider graph proves the existence of graphs with $\Delta\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)=\Delta(\mathrm{G})$. The wounded spider graph stands as an example of graphs with $\Delta\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)=\Delta(\mathrm{G})+\eta$. For example the graphs $\mathrm{G}_{1}, \mathrm{G}_{2}, \mathrm{G}_{3}$ with $\Delta\left(\mathrm{S}_{\gamma}\left(\mathrm{G}_{1}\right)\right)=\Delta\left(\mathrm{G}_{1}\right), \Delta\left(\mathrm{S}_{\gamma}\left(\mathrm{G}_{2}\right)\right)=\Delta\left(\mathrm{G}_{2}\right)+\eta$ and $\Delta\left(\mathrm{S}_{\gamma}\left(\mathrm{G}_{3}\right)\right)=\gamma(\mathrm{G})$ respectively are shown in Figure 16. Here $\mathrm{G}_{1}$ is the spider graph on 9 vertices, $\mathrm{G}_{2}$ is the wounded spider graph on 5 vertices and $\mathrm{G}_{3}$ is the path graph on 12 vertices.

## III. DISTANCE PROPERTIES OF $\gamma$-SPLITTING GRAPHS

Here we are interested in studying about the distance properties in $S_{\gamma^{-}}$-graphs. Also normally we expect diam $\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)<\operatorname{diam}(\mathrm{G})$. But there are graphs with $\operatorname{diam}\left(\mathrm{S}_{\gamma}(\mathrm{G})\right) \geq \operatorname{diam}(\mathrm{G})$. This behaviour gives rise to following three definitions $\mathrm{S}_{\gamma}{ }^{+}$-graphs, $\mathrm{S}_{\gamma}{ }^{-}$-graphs, and $\mathrm{S}_{\gamma}{ }^{*}$-graphs as given below:
A graph G is called a $S_{\gamma}{ }^{+}$-graph if $\operatorname{diam}(\mathrm{G})<\operatorname{diam}\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)$.
It is called a $S_{\gamma}^{-}-\operatorname{graph}$ if $\operatorname{diam}(\mathrm{G})>\operatorname{diam}\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)$.
Finally, it is said to be a $S_{\gamma}{ }^{*}$ graph if $\operatorname{diam}(G)=\operatorname{diam}\left(\mathrm{S}_{\gamma}(\mathrm{G})\right)$. For example, $\mathrm{S}_{\gamma}{ }^{+}, \mathrm{S}_{\gamma}{ }^{-}$, and $\quad \mathrm{S}_{\gamma}{ }^{*}$-graphs are shown in Figure 17.

Theorem 3.1 For any graph $G$, the distance between newly added vertices in $S_{\gamma}(\mathrm{G})$ is 2 or 3 .
Proof Let $G$ be any graph of order $n$, and $w_{1}$ and $w_{2}$ be any two newly added vertices in $S_{\gamma}(G)$. We know that $d^{*}\left(w_{i}\right)=\gamma(G), 1 \leq i$ $\leq \eta$ and $\mathrm{d}\left(\mathrm{w}_{1}, \mathrm{w}_{2}\right) \geq 2$ (Fact 2.1).
Case (i) Suppose $N\left(w_{1}\right) \cap N\left(w_{2}\right) \neq \varphi$. Let $x \in N\left(w_{1}\right) \cap N\left(w_{2}\right)$. Then $x$ is the common neighbour of $w_{1}$ and $w_{2}$, and so $d\left(w_{1}, w_{2}\right)=$ 2.

Case (ii) Suppose $N\left(w_{1}\right) \bigcap N\left(w_{2}\right)=\varphi$. Then let $\mathrm{x} \in \mathrm{N}\left(\mathrm{w}_{1}\right)$. Since $\mathrm{N}\left(\mathrm{w}_{1}\right)$ is a $\gamma$-set, every vertex in $\mathrm{N}^{\mathrm{c}}\left(\mathrm{w}_{1}\right)$ is adjacent to at least one vertex in $N\left(w_{1}\right)$. But $N\left(w_{2}\right) \subseteq N^{c}\left(w_{1}\right)$. Therefore, there exists a vertex $y \in N\left(w_{2}\right)$ such that $y$ is adjacent to a vertex $x$ in $N\left(w_{1}\right)$. Then $\mathrm{d}\left(\mathrm{w}_{1}, \mathrm{w}_{2}\right)=3$.
Theorem 3.2 For any graph $\mathrm{G}, \operatorname{diam}\left(\mathrm{S}_{\gamma}(\mathrm{G})\right) \leq 4$.
Proof Let G be any graph and $\mathrm{S}_{\gamma}(\mathrm{G})$ be its corresponding $\gamma$-splitting graph. Let $u$ and $v$ be any two vertices in $\mathrm{S}_{\gamma}(\mathrm{G})$. We claim that $\mathrm{d}(\mathrm{u}, \mathrm{v}) \leq 4$ for every $\mathrm{u}, \mathrm{v} \in \mathrm{V}(\mathrm{G})$.
Case (i) If $u$ and $v$ are newly added vertices in $\mathrm{S}_{\gamma}(\mathrm{G})$. By Theorem 3.1, $\mathrm{d}(\mathrm{u}, \mathrm{v}) \leq 3$.
Case (ii) If $u$ is a newly added vertex and $v \in V(G)$. Then $N(u)$ is a dominating set, and therefore $v \in N(u)$ or $v$ is adjacent to a vertex in $\mathrm{N}(\mathrm{u})$ in $\mathrm{S}_{\gamma}(\mathrm{G})$. This forces that $\mathrm{d}(\mathrm{u}, \mathrm{v}) \leq 2$.
Case (iii) Suppose $u, v \in V(G)$. Then there arise two subcases.
Subcase (i) Let $u$ belong to a $\gamma$-set $S$. Then there is a newly added vertex $w$ corresponding to $S$. If $v \in S$, then $u w v$ is a $u$-v path of length 2 in $S_{\gamma}(G)$. Therefore $d(u, v) \leq 2$. If $v \notin S$, then there is a vertex $v_{1}$ in $S$, adjacent to $v$. Therefore $u w v_{1} v$ is a $u$-v path of length 3 , and so $\mathrm{d}(\mathrm{u}, \mathrm{v}) \leq 3$. If v belongs to any other $\gamma$-set, then in a similar way we can show that $\mathrm{d}(\mathrm{u}, \mathrm{v}) \leq 3$.
Subcase (ii) Neither u nor v belongs to any $\gamma$-set. Fix a newly added vertex w. Clearly, $\mathrm{N}(\mathrm{w})$ is a $\gamma$-set. So $\mathrm{V}(\mathrm{G}) \subseteq \mathrm{N}(\mathrm{N}(\mathrm{w})$ ) in $\mathrm{S}_{\gamma}(\mathrm{G})$. Therefore, $\mathrm{d}(\mathrm{u}, \mathrm{v}) \leq 4$. Hence $\operatorname{diam}\left(\mathrm{S}_{\gamma}(\mathrm{G})\right) \leq 4$.
The inequality stated above is strict. For example, $\operatorname{diam}\left(\mathrm{S}_{\gamma}\left(\mathrm{P}_{3 \mathrm{k}}\right)\right)=4$, for any $\mathrm{k} \geq 2$. For example, $\operatorname{diam}\left(\mathrm{S}_{\gamma}\left(\mathrm{P}_{6}\right)\right)=4$ can be verified in Figure 18.

## International Journal for Research in Applied Science \& Engineering Technology (IJRASET)

Figure 18
The following corollary gives a characterisation of $\mathrm{S}_{\gamma}{ }^{-}$-graphs.
Corollary 3.3 Any connected graph G with $\operatorname{diam}(\mathrm{G})>4$, is a $\mathrm{S}_{\gamma}{ }^{-}$-graph.
Proof Suppose G is a connected graph and $\operatorname{diam}(\mathrm{G})>4$. Let $\mathrm{S}_{\gamma}(\mathrm{G})$ be its corresponding $\quad \gamma$-splitting graph. By Theorem 3.2, $\operatorname{diam}\left(\mathrm{S}_{\gamma}(\mathrm{G})\right) \leq 4$ and the result follows.

It has been prove in [7], that $\eta\left(\mathrm{P}_{\mathrm{n}}\right)=\left\{\begin{array}{l}1 \quad \text { if } \mathrm{n}=3 \mathrm{k}, \mathrm{k} \geq 1 \\ \frac{k^{2}+5 k+2}{2^{\text {if } \mathrm{n}=3 \mathrm{k}+1}, \mathrm{k} \geq 0} \\ k_{\text {if }} \mathrm{f}=3 \mathrm{k}+2, \mathrm{k} \geq 0\end{array}\right.$
and
$\eta\left(\mathrm{C}_{\mathrm{n}}\right)=\left\{\begin{array}{lc}3 & \text { if } \mathrm{n}=3 \mathrm{k}, \mathrm{k} \geq 1 \\ \frac{(3 k+1)(k+2)}{2} & \text { if } \mathrm{n}=3 \mathrm{k}+1, \mathrm{k} \geq 1 \\ 3 k+2 & \text { if } \mathrm{n}=3 \mathrm{k}+2, \mathrm{k} \geq 1\end{array}\right.$
Proposition 3.4 The path graph $\mathrm{P}_{\mathrm{n}}$ is $\mathrm{S}_{\gamma}{ }^{+}$-graph if $\mathrm{n} \leq 2, \mathrm{~S}_{\gamma}{ }^{*}$-graph if $\mathrm{n}=3,4$, and $\mathrm{S}_{\gamma}{ }^{-}$-graph if $\mathrm{n} \geq 5$.
Proposition 3.5 The cycle graph $\mathrm{C}_{\mathrm{n}}$ is $\mathrm{S}_{\gamma}{ }^{+}$-graph if $\mathrm{n} \leq 5, \mathrm{~S}_{\gamma}{ }^{*}$-graph if $\mathrm{n}=6,7$, and $\mathrm{S}_{\gamma}{ }^{-}$-graph if $\mathrm{n} \geq 8$.
